Grant Management System

Overview

Derived from Synergy's flagship Aid Management system, DAD, implemented in more than 40 countries around the world, Synergy Grants Management System is a flexible and customizable solution, which holistically addresses grantee and grantor issues at a granular level. It allows the Grantor to examine grant applications, track grant implementation and payments, as well as present the detailed and strategic views of the Grantmaking organization. The Grantee, on the other hand, receives the opportunity to apply for Grants online, manage grant implementation and report on grant progress.

Key Features

Application Management

The Grant Management System includes a web-based process for the submission/review/approval of grant applications. This tool allows the Grantor ownership over the process; it promotes transparency, maximizes and optimizes grant contribution, and avoids duplication and overlap. Importantly, it also simplifies the Grant Application process for the Grantees.

Workflow Designer

With Synergy's Workflow Designer, the Grantor is able to make internal decisions on the allocation of grants, as well as track information, plan and schedule grant-related activities. Workflow Designer allows the Grantor to create and modify grant-flow processes and user actions on the fly.

Reporting and Analytics

The powerful Reporting and Analytics engine allows the Grantor to examine interim grant implementation data, monitor grant implementation progress and compile complex reports. Users can access scores of predefined Reports, as well as query the database and generate real-time analytics and data visualization dashboards.

Financial Management

The Financial Management module allows to capture, track, and analyze financial data associated with the grant. The Grantmaking organization can track any type of financial flows, from high-level financial data such as project costs to more detailed information related to payment schedules or activity-level costs and expenditures.

Intelligent Grant Allocation

The Workflow Designer allows the Grantor to automatically notify the relevant grant applicants and potential grantees about new grant opportunities.

Results Management

After the conclusion of the grant cycle, all parties will be able to estimate the complete value and impact of the grant.

Interoperability

The Grant Management System has the underlying interoperability capability to support data exchange with relevant MIS to ensure an effective flow of data and prevent duplication and silos of information.

Secure Role-based Access

Users with field-level access to system modules based on their role within the grantmaking or grantee organization ensuring the security and confidentiality of sensitive data.
