

## Cloud Commander, Tenant to Tenant Migrations within Office 365

What's the problem with Tenant to Tenant Migrations? Migrations across Exchange organizations have always been difficult projects for companies, and that was when they had full control of the servers and methodology. With the explosive popularity of Office 365, this problem still exists, but there is even less control for companies to accomplish these difficult tasks.

### Introducing Quadrotech Cloud Commander

Once deployed, source and target mailboxes are matched and entered into a migration wave. These migration waves are then scheduled to move mailbox data. Once enabled for migration, Cloud Commander utilizes Quadrotech's Advanced Ingestion Protocol (AIP) technology to facilitate the fast transfer of data. Once data has been migrated, mailboxes are completed or "switched". This means that Cloud Commander will adjust Active Directory, Azure AD, or Exchange Online objects to complete the migration, and enable coexistence. Finally, a workstation agent will be triggered to update the end user Outlook profile.

- Cloud Commander is **deployed in your Azure environment**, so your data does not exist anywhere you don't want it to.
- **An additional benefit is speed** - the fastest migrations are those closest to the data, thus commands top speeds for your data transfer.
- **Advanced Ingestion Protocol (AIP) technology** for both the export and import of data to achieve **rapid data transfer rates**.
- Once a mailbox has been selected for migration, the profile will be reconfigured programmatically, **keeping end users working and reducing migration-related help desk tickets**.

### Remove Complexity and Inefficiency

Most Merger & Acquisitions will encounter a slowdown when there are multiple Office 365 tenants. Cloud Commander will ease complications and enable a smooth transition.

Multiple Office 365 tenants are an administrative burden. By consolidating tenants, you gain both administrative *and* end user efficiencies.

### Improve End User Experience

Cloud Commander enables messaging and calendar coexistence throughout the migration process, meaning that end users are still able to collaborate during the transition.

Users that have been migrated and updated to their new mailbox are still able to see the availability of pre-migrated users, and vice versa.

### Achieve Regulatory Compliance

Cloud Commander facilitates the move from an Office 365 data center to more specialized regional locations.

For example, an organization could have mailboxes hosted in Northern Europe but need to move the tenant to Microsoft Cloud Germany – Cloud Commander handles location changes without hassle, complications or disruption.
