

Asset Tracking

Businesses looking to maximise profits need to be able to keep track of all aspects of their assets, and the only way to effectively accomplish that is through an advanced asset tracking software.

When thinking about data collection tools, organisations need to consider variables beyond just physical location. Asset Tracking software should track an asset's physical whereabouts to help deter theft, in addition to its lifecycle and dwell time history.

Asset management solutions allow organisations to make informed decisions while guiding the company forward by providing details about the company asset such as dwell time, asset lifecycle history.

COREIoT's Critical Spares Management module is optionally available to ensure real-time monitoring and alerting of inventory levels at zone levels. Critical Spares Management solution can help pinpoint, prioritise and prevent inventory stock discrepancies by timely notifying when procurement of spares is needed, thus saving downtime costs.

Features and Benefits

Real-time asset management

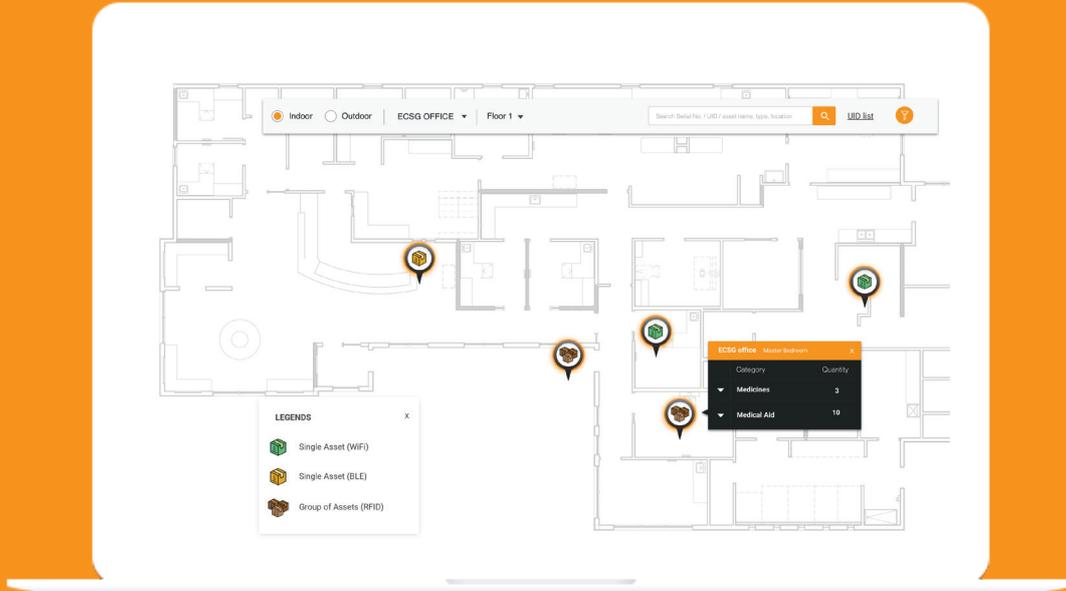

Increase productivity and reduce labour waste

Avoid unnecessary repair and maintenance costs through the asset lifecycle

Ensure regulatory compliance

How it works?

COREIoT provides sensor-based asset management solution which enables the collection of real-time, zone-based asset location and utilisation data.

- COREIoT Gateways are placed in the relevant monitoring zones.
- COREIoT Sensor tags are placed/affixed on the assets that need to be tracked.
- The tags enable asset visibility by sending frequent bursts of data over the network to COREIoT's cloud/on-premise platform.
- The COREIoT Asset Tracking solution utilises this data to provide comprehensive asset information such as its location, dwell time, operational lifecycle status, utilisation and other statistics.
