

PLOSSYS 5

Output Management from the Cloud

With PLOSSYS netdome, SEAL Systems has been providing a robust and powerful corporate output management engine trusted by over 1,500 customers for 25 years. PLOSSYS 5, our newest product from the PLOSSYS line, is specially designed for cloud operation in architecture and technology, without having to forgo the possibilities of on-premises installation. Both types of operation can even be combined in the future.

With PLOSSYS 5 you can use both the trusted properties of the PLOSSYS line and the latest software technology, e.g. for operating in the Cloud.

PLOSSYS 5's central aspect is its microservice architecture: The monolithic structure of earlier products was broken up and divided into small, modular service units which cooperate flexibly with one another. This makes PLOSSYS 5 not only able to combine the right services for every use case, but also to react flexibly to variable load situations. Multiple services of similar type can be activated if needed. PLOSSYS 5 always ensures seamless integration, regardless of whether these services work on-premises or in the Cloud.

YOUR BENEFITS: PLOSSYS 5 IS...

+ ... fast

PLOSSYS 5 is designed for high throughput and short response times. Have a million print jobs that have to be printed that day? No problem. That's what makes PLOSSYS 5 interesting, especially for time-critical applications like POS- and label printing.

+ ... safe

In this time of global theft, the effective protection of your documents is of existential importance. Even if the path to the printer leads through the public Cloud, your data is safe. PLOSSYS 5 uses strong encryption and robust security technology to make life hard for hackers.

+ ... flexible

PLOSSYS 5 consists of modular components that can be flexibly assembled, scaled according to performance requirements and optimized for different application scenarios. With PLOSSYS 5 you can adapt your output management solution to your requirements - not vice versa.

+ ... fault tolerant

Print services don't fail! PLOSSYS 5 does everything to ensure that this promise is kept. And if your services, computer, or whole data center should fail – it's not a problem. PLOSSYS 5 recognizes the situation and automatically switches to other resources for its services.

+ ... cloud ready

With its microservice architecture, PLOSSYS 5 is a genuine cloud application which can run in public, private or hybrid cloud environments and also be installed on-premises. Different operating models can be combined. And the necessary processing of print jobs on-the-fly considerably speeds up the output.

+ ... serverless

With PLOSSYS 5 you can realize corporate output management from the Cloud without server components in your own IT landscape. Manage your solutions globally in the Cloud. The PLOSSYS client creates the connection to the local printer. And when you need more than printing, PLOSSYS Print Appliance ensures for optimal distribution between local processing and cloud operation. And furthermore: even if you want to operate PLOSSYS 5 on-premises, part of the processing can be easily stored in the Cloud.
