

Any time goods cross borders, customs authorities need to be informed, usually by means of an electronic customs declaration. This is a time-critical process in the supply chain, and one that customs managers often handle manually because of differing rules, regulations, data structures, and communication protocols—even within a single customs jurisdiction like the EU.

Customs4Trade’s Customs Accounting System (CAS) Declarations Module automates the customs declaration process, accelerating import/export time, ensuring compliance, and providing a holistic view of your customs and trade operations. Say goodbye to brokers and third-party customs declarants. C4T’s CAS Declarations Module allows you to take control of your international commerce and provides the data you need to optimize operations.

Key Benefits

Speed to Market

RESTful APIs allow for easy integration into ERP or WMS. Before you know it, your declarations will be fully centralised and automated, accelerating your customs and trade operations.

Visibility

Gain insights, monitor KPIs, and get instant status reports with an intuitive dashboard that provides a consolidated, real-time overview across all operations.

Global Standard

The CAS internal data model for declarations is based on the World Customs Organisation (WCO) data model.

Assured Compliance

C4T’s customs experts continually update the system and legal content with changes to customs law, so you can rest assured you’re in compliance.

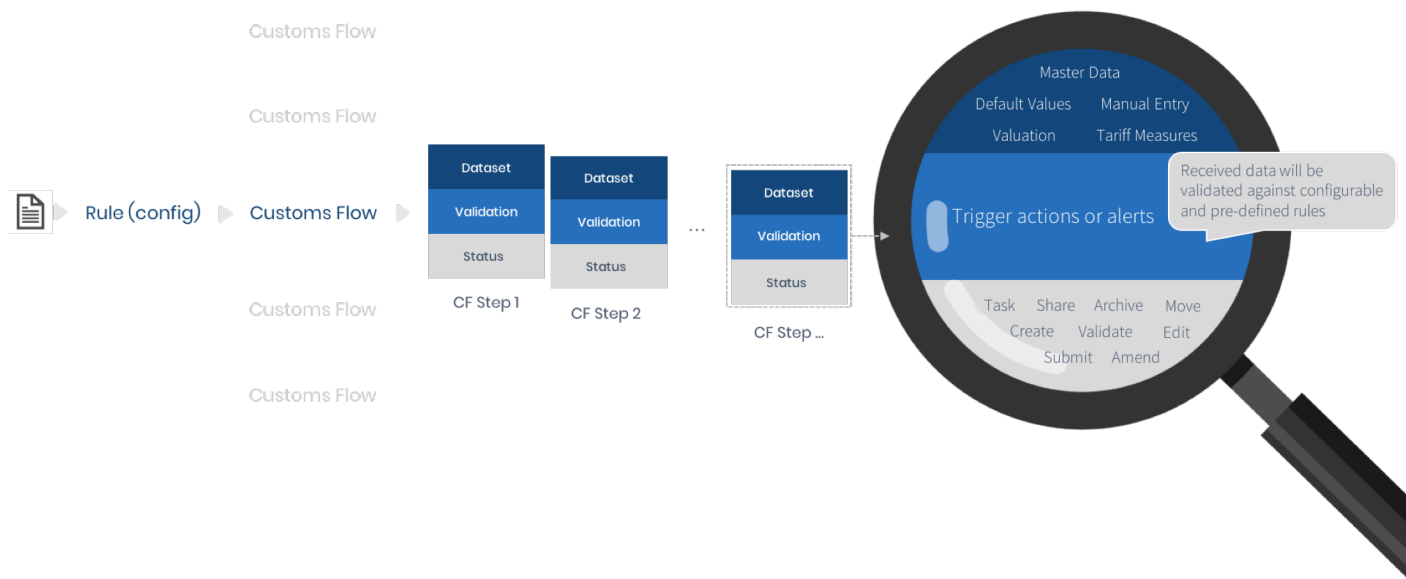

Scalable

Gain organizational agility with the ability to quickly onboard cross-border trade flows or downscale when focusing on the local market.

How it works

C4T's CAS Declarations Module enables you to automate multiple declaration types in multiple countries, supporting import, export, and transit declarations.

To bridge the gap between article-based logistics systems and declaration-based customs procedures, CAS uses the concept of a Customs Shipment. A Customs Shipment is a shipment which needs to be cleared for unloading or departure, and can be triggered by an ASN, PO or SO, invoice, or factory complete message.

Once the shipment is established, the process begins by sending lightweight Customs Shipment data on any inbound or outbound shipments to CAS, which integrates seamlessly with your ERP or WMS. This data submission triggers a rule which then auto-selects the appropriate Customs Flow. Customs Flows include different declaration steps and deliver the requisite data to customs, port community systems and business partners. Each Customs Flow is configurable and can aggregate data according to the need, including master data, valuation, tariff measures, and any other default data or manually entered data necessary for compliance.

The CAS Declarations Module files the declaration, shares information with business partners, automatically resubmits data if needed, and provides exit confirmation—all with little to no human intervention. Multiple user profiles including Declarant, Warehouse Operator, Customs Manager, and Customs Broker provide different roles with exactly the information they need to see via the role-based dashboard.

Ensure compliance and accelerate your customs and trade operations with C4T's CAS Declarations Module.
