

# We close the deployment gap's in Intune!

Working with Windows Intune?

Looking for a smart solution for your deployment?

Want to save time, money and workload in your IT environment?

# SYNTARO – Modules for a Lightweight Managed Clients

## Application Management – Flexible Intune Extension

You have no longer restrictions for single MSI files when distributing software (Intune customers' pain number one!). This module allows you to distribute your apps easily on all your devices. It enables a worldwide and secure distribution of all apps over the Internet.

## WimAsAService – Your WIM File Generator

WimAsAService is an innovative online Service which allows you to configure WIM (Windows® Imaging Format) files according to your personal requirements. The WIM files are then generated on our infrastructure. After generating such an image, you can download your own WIM file directly through your web browser.

## Enrollment App – The Advanced AutoPilot Wizard

The Enrollment App is a user friendly customizable Wizard for Device Enrollments. The App enables your Users to configure Devices on their own and works perfectly together with Intune and Windows AutoPilot. We provide some example steps, but you can add any specific requirements on your own.

## GPO to MSI – Simplify Device Management Policies

Group Policy to MSI enables an administrator to deploy the same policies to Intune managed Devices as he can with Active Directory. The easy to use wizard allows to convert a Group Policy Object (GPO) or a local Group Policy to an MSI file, which can be deployed to Intune managed clients.

WimAsAService has allowed ECNO's Shared Technical Services team to accelerate the implementation of Windows 10 as the base operating system for all of its member boards, freeing up IT resources and time to dedicate to other projects and issues.»
