

Outdoor Asset Tracking

Businesses looking to maximise profits need to be able to keep track of all aspects of their assets, and the only way to effectively accomplish that is through advanced asset tracking software.

When thinking about data collection tools, organisations need to consider variables beyond just physical locations. Asset Tracking software should track an asset's physical whereabouts to help deter theft, in addition to its lifecycle and whereabouts in the field.

Asset Tracking solutions allow organisations to make informed decisions while guiding the company forward by providing details about the company assets such as dwell time, asset life cycle history and current location.

Features and Benefits

Create virtual boundaries defining ideal operational area for assets.

Generate alerts when assets enter or exit a virtual boundary

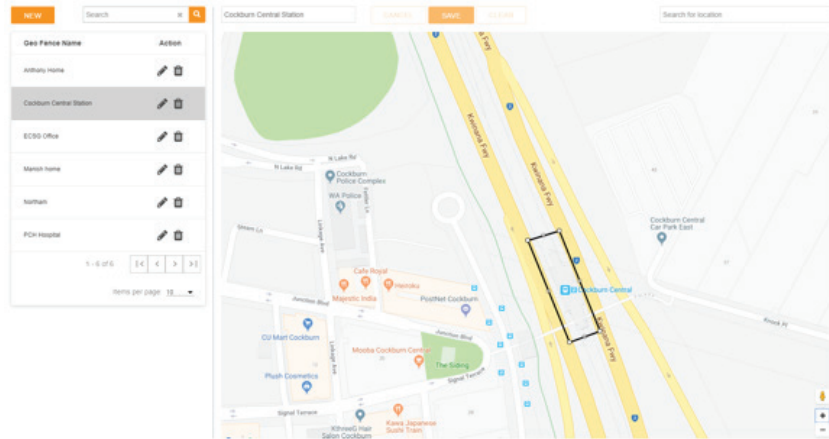

Continuous tracking of mobile assets

Real time monitoring of outdoor assets

Increased productivity and reduction in labour waste

How it works?

COREIoT provides a GPS based asset tracking solution which enables businesses to monitor asset location and view real time alerts.

- COREIoT GPS Sensors are placed in/on the relevant assets.
- Geofences are established in COREIoT, creating zones which are continuously monitored.
- The sensors enable asset visibility by sending frequent bursts of data to COREIoT's cloud platform.
- Workflows are established to create real time alerts for each asset when they leave or exit one of the predefined Geofences.
- COREIoT's Outdoor asset tracking module provides real-time insight into the location of various assets in the field and notifies users for any breaches in Geofenced areas.
