

TIBCO Jaspersoft®

Embedded Analytics for SaaS

The users of your applications want answers. Software builders that embed reports and dashboards into their apps make it easy for users to find answers from data and take action.

What is TIBCO Jaspersoft?

TIBCO Jaspersoft helps software builders unlock the potential of data for their users. Unlike most BI tools, Jaspersoft is deliberately designed to be embedded into other software applications. It helps developers create data experiences in their apps that surface answers for non-technical, non-analyst users.

Why customers use TIBCO Jaspersoft?

This at-a-glance box

- Beautiful visualizations that blend into your app
- Open architecture for flexible connectivity & deployments
- Centralized management of analytics across SaaS customers
- 100% API coverage

Answer-generating applications

- Pixel-perfect design environment
- JavaScript API to seamlessly embed visualizations
- Support for third-party charting libraries like D3.js

You make happy customers

Flexible architecture

- Container support for technologies like Docker
- Open architecture for deploying in any environment
- Open source base enables customizations and extensions

Evolve easily with your changing app

Advanced security

- Multi-tenant support for managing large deployments
- Spring Security foundation allows any authentication approach
- Row- and column-level data security

Configure security easily & get granular control

"Jaspersoft allowed us to present information in a really modular, scalable fashion. So no matter what question was being asked, we wanted to have the application answer that question the way the customer wants, not the way the technology defines it."

– Peter Girgis, Chief Technology Officer, BigMate
