CHANGE TRACKING

A thorough history of every change in your records

See the full story of your records by understanding what changed, who made changes, and when.

Details in your records move as quickly as your business does. The Change Tracking app holds everyone accountable and provides more transparency so that your team can get the answers and context they need faster.

KEY FEATURES

Jumbled batches of updated records require time and attention to sort. Get organized filterable details to quickly identify relevant changes, update records, and get in touch with the person responsible.

Record Details
drill deep into line item changes so that updates to pricing, delivery details, and client information never go unnoticed

Record Relation
create and compare relationships between any record and its source record

Condition Table Filter
verify that all filters match the record under given conditions

History Records
see all instances of a record that's been changed or batched

Change Button Search
open a report to search for changes in a record in the selected table based on the primary key

Batch Update Records
select and update certain active records OR choose to update all active records

USE CASES

An unexpected change in a SKU item price requires some background investigation. With little effort, open the record to view the entire history of edits and their authors to understand the justification of the change and act accordingly.

A sudden modification to the shipping address flags an error prior to delivery – quickly filter the record to contact the author to double check the source documents and correct the address.

If a Sales Order gets deleted, use the Change button Search to find the Sales Order, determine when it was deleted, and which user deleted the record to follow up internally.

CHANGE TRACKING

INSTALLATION

1. Setup can be done in minutes
