

Agricultural Farm Remote Monitoring Dashboard

Powered by Microsoft Power BI

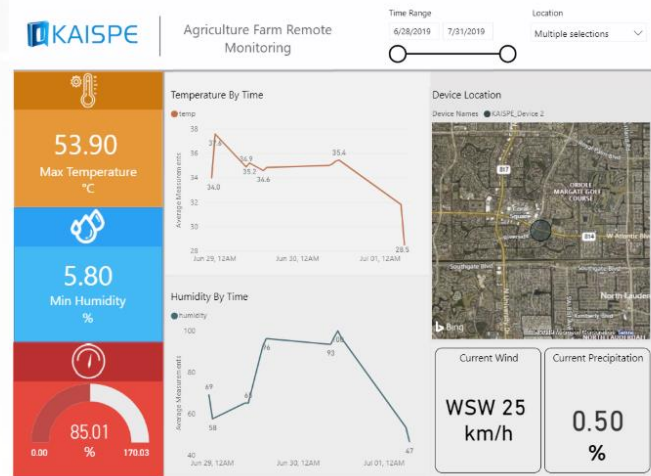

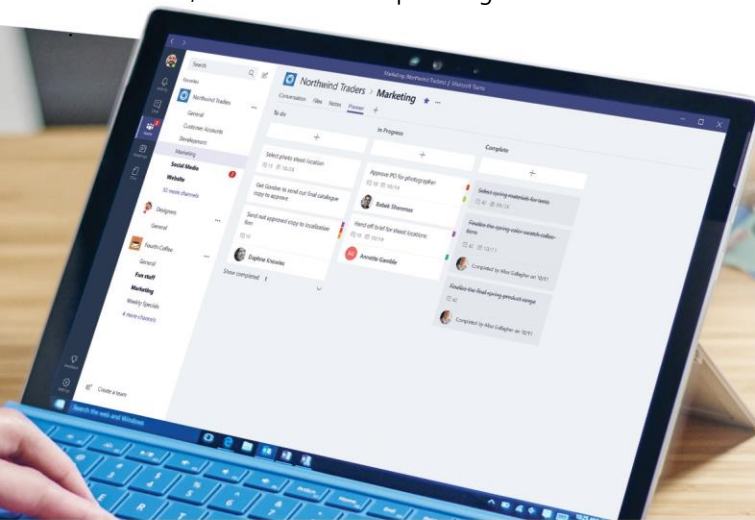

A Dashboard for Farming

Get insights into IoT device data installed in a farm field to remotely monitor the crops. Comprehensive view of different key measurements like soil moisture, air temperature, weather forecast etc. Farmers can get insights like when and how much irrigation is required for the crops which helps them save water resources and results in higher crops growth

Built using Highly Scalable Data Source Architecture

The dashboard gets the telemetry data through SaaS based Microsoft Azure IoT Central application and apply data modelling to present useful device information, KPIs and other helpful insights.

Customize for Your Farm

Tailor the dashboard to include the insights you need as per your requirements. You can connect it with other sources of telemetry information by using the default connection sources available in Power BI. Add reports and visuals to get more information that helps you make right decision about irrigation.
