Study Guide

Exam AZ-400: Designing and Implementing Microsoft DevOps Solutions

Purpose of this document

This study guide should help you understand what to expect on the exam and includes a summary of the topics the exam might cover and links to additional resources. The information and materials in this document should help you focus your studies as you prepare for the exam.

<table>
<thead>
<tr>
<th>Useful links</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>How to earn the certification</strong></td>
<td>Some certifications only require one exam, while others require more. On the details page, you'll find information about what skills are measured and links to registration. Each exam also has its own details page covering exam specifics.</td>
</tr>
<tr>
<td><strong>Certification renewal</strong></td>
<td>Once you earn your certification, don’t let it expire. When you have an active certification that’s expiring within six months, you should renew it—at no cost—by passing a renewal assessment on Microsoft Learn. Remember to renew your certification annually if you want to retain it.</td>
</tr>
<tr>
<td><strong>Your Microsoft Learn profile</strong></td>
<td>Connecting your certification profile to Learn brings all your learning activities together. You’ll be able to schedule and renew exams, share and print certificates, badges and transcripts, and review your learning statistics inside your Learn profile.</td>
</tr>
<tr>
<td><strong>Passing score</strong></td>
<td>All technical exam scores are reported on a scale of 1 to 1,000. A passing score is 700 or greater. As this is a scaled score, it may not equal 70% of the points. A passing score is based on the knowledge and skills needed to demonstrate competence as well as the difficulty of the questions.</td>
</tr>
<tr>
<td><strong>Exam sandbox</strong></td>
<td>Are you new to Microsoft certification exams? You can explore the exam environment by visiting our exam sandbox. We created the sandbox as an opportunity for you to experience an exam before you take it. In the sandbox, you can interact with different question types, such as build list, case studies,</td>

and others that you might encounter in the user interface when you take an exam. Additionally, it includes the introductory screens, instructions, and help topics related to the different types of questions that your exam might include. It also includes the non-disclosure agreement that you must accept before you can launch the exam.

**Request accommodations**
We’re committed to ensuring all learners are set up for success. If you use assistive devices, require extra time, or need modification to any part of the exam experience, you can request an accommodation.

**Take a practice test**
Taking a practice test is a great way to know whether you’re ready to take the exam or if you need to study a bit more. Subject-matter experts write the Microsoft Official Practice Tests, which are designed to assess all exam objectives.

**Objective domain: skills the exam measures**
The English language version of this exam will be updated on November 1, 2022. If you’re taking this exam’s English version before this date, the following Skills Measured is what you should study. If you want to review changes to the future version, scroll to the end of this document.

Some exams are localized into other languages, and those are updated approximately eight weeks after the English version is updated. Other available languages are listed in the Schedule Exam section of the Exam Details webpage. If the exam isn’t available in your preferred language, you can request an additional 30 minutes to complete the exam.

**Note**
The bullets that follow each of the skills measured are intended to illustrate how we are assessing that skill. Related topics may be covered in the exam.

**Note**
Most questions cover features that are general availability (GA). The exam may contain questions on Preview features if those features are commonly used.

**Skills measured**

- Configure processes and communications (10–15%)
- Design and implement source control (15–20%)
- Design and implement build and release pipelines (40–45%)
- Develop a security and compliance plan (10–15%)
• Implement an instrumentation strategy (10–15%)

**Functional groups**

**Configure processes and communications (10–15%)**

**Configure activity traceability and flow of work**
- Plan and implement a structure for the flow of work and feedback cycles
- Identify appropriate metrics related to flow of work, such as cycle times, time to recovery, and lead time
- Integrate pipelines with work item tracking tools, such as Azure DevOps and GitHub
- Implement traceability policies decided by development
- Integrate a repository with Azure Boards

**Configure collaboration and communication**
- Communicate actionable information by using custom dashboards in Azure DevOps
- Document a project by using tools, such as wikis and process diagrams
- Configure release documentation, including release notes and API documentation
- Automate creation of documentation from Git history
- Configure notifications by using webhooks

**Design and implement source control (15–20%)**

**Design and implement a source control strategy**
- Design and implement an authentication strategy
- Design a strategy for managing large files, including Git LFS and git-fat
- Design a strategy for scaling and optimizing a Git repository, including Scalar and cross-repository sharing
- Implement workflow hooks

**Plan and implement branching strategies for the source code**
- Design a branch strategy, including trunk-based, feature branch, and release branch
- Design and implement a pull request workflow by using branch policies and branch protections
- Implement branch merging restrictions by using branch policies and branch protections

**Configure and manage repositories**
- Integrate GitHub repositories with Azure Pipelines, one of the services in Azure DevOps
- Configure permissions in the source control repository
- Configure tags to organize the source control repository
- Recover data by using Git commands
- Purge data from source control
Design and implement build and release pipelines (40–45%)

Design and implement pipeline automation
- Integrate pipelines with external tools, including dependency scanning, security scanning, and code coverage
- Design and implement quality and release gates, including security and governance
- Design integration of automated tests into a pipeline
- Design and implement a comprehensive testing strategy
- Implement orchestration of tools, such as GitHub Actions and Azure Pipelines

Design and implement a package management strategy
- Design a package management implementation that uses Azure Artifacts, GitHub Packages, NuGet, and npm
- Design and implement package feeds, including upstream sources
- Design and implement a dependency versioning strategy for code assets and packages, including semantic versioning and date-based
- Design and implement a versioning strategy for pipeline artifacts

Design and implement pipelines
- Select a deployment automation solution, including GitHub Actions and Azure Pipelines
- Design and implement an agent infrastructure, including cost, tool selection, licenses, connectivity, and maintainability
- Develop and implement pipeline trigger rules
- Develop pipelines, including classic and YAML
- Design and implement a strategy for job execution order, including parallelism and multi-stage
- Develop complex pipeline scenarios, such as containerized agents and hybrid
- Configure and manage self-hosted agents, including virtual machine (VM) templates and containerization
- Create reusable pipeline elements, including YAML templates, task groups, variables, and variable groups
- Design and implement checks and approvals by using YAML environments

Design and implement deployments
- Design a deployment strategy, including blue/green, canary, ring, progressive exposure, feature flags, and A/B testing
- Design a pipeline to ensure reliable order of dependency deployments
- Plan for minimizing downtime during deployments by using VIP swap, load balancer, and rolling deployments
- Design a hotfix path plan for responding to high-priority code fixes
- Implement load balancing for deployment, including Azure Traffic Manager and the Web Apps feature of Azure App Service
• Implement feature flags by using Azure App Configuration Feature Manager
• Implement application deployment by using containers, binary, and scripts

**Design and implement infrastructure as code (IaC)**
• Recommend a configuration management technology for application infrastructure
• Implement a configuration management strategy for application infrastructure, including IaC
• Define an IaC strategy, including source control and automation of testing and deployment
• Design and implement desired state configuration for environments, including Azure Automation State Configuration, Azure Resource Manager, Bicep, and Azure Policy guest configuration

**Maintain pipelines**
• Monitor pipeline health, including failure rate, duration, and flaky tests
• Optimize pipelines for cost, time, performance, and reliability
• Analyze pipeline load to determine agent configuration and capacity
• Design and implement a retention strategy for pipeline artifacts and dependencies

**Develop a security and compliance plan (10–15%)**

**Design and implement a strategy for managing sensitive information in automation**
• Implement and manage service connections
• Implement and manage personal access tokens
• Implement and manage secrets, keys, and certificates by using Azure Key Vault, GitHub secrets, and Azure Pipelines secrets
• Design and implement a strategy for managing sensitive files during deployment
• Design pipelines to prevent leakage of sensitive information

**Automate security and compliance scanning**
• Automate analysis of source code by using GitHub code scanning, GitHub secrets scanning, pipeline-based scans, and SonarQube
• Automate security scanning, including container scanning and OWASP ZAP
• Automate analysis of licensing, vulnerabilities, and versioning of open-source components by using WhiteSource and GitHub Dependency Scanning

**Implement an instrumentation strategy (10–15%)**

**Configure monitoring for a DevOps environment**
• Configure and integrate monitoring by using Azure Monitor
• Configure and integrate with monitoring tools, such as Azure Monitor and Application Insights
• Manage access control to the monitoring platform
• Configure alerts for pipeline events
Analyze metrics
- Inspect distributed tracing by using Application Insights
- Inspect application performance indicators
- Inspect infrastructure performance indicators, including CPU, memory, disk, and network
- Identify and monitor metrics for business value
- Analyze usage metrics by using Application Insights
- Interrogate logs using basic Kusto Query Language (KQL) queries

Study Resources
We recommend that you train and get hands-on experience before you take the exam. We offer self-study options and classroom training as well as links to documentation, community sites, and videos.

Audience Profile

DevOps engineers are developers or infrastructure administrators who also have subject matter expertise in working with people, processes, and products to enable continuous delivery of value in organizations.

Responsibilities for this role include designing and implementing strategies for collaboration, code, infrastructure, source control, security, compliance, continuous integration, testing, delivery, monitoring, and feedback.

DevOps engineers work on cross-functional teams that include developers, site reliability engineers, and Azure administrators.

DevOps engineers must have experience with administering and developing in Azure, with strong skills in at least one of these areas. They should be familiar with both Azure DevOps and GitHub.

Functional groups

Configure processes and communications (10–15%)

Configure activity traceability and flow of work

- Plan and implement a structure for the flow of work and feedback cycles
- Identify appropriate metrics related to flow of work, such as cycle times, time to recovery, and lead time
- Integrate pipelines with work item tracking tools, such as Azure DevOps and GitHub
- Implement traceability policies decided by development
- Integrate a repository with Azure Boards

Configure collaboration and communication

- Communicate actionable information by using custom dashboards in Azure DevOps
- Document a project by using tools, such as wikis and process diagrams
- Configure release documentation, including release notes and API documentation
- Automate creation of documentation from Git history
- Configure notifications by using webhooks
Design and implement source control (15–20%)

Design and implement a source control strategy
- Design and implement an authentication strategy
- Design a strategy for managing large files, including Git LFS and git-fat
- Design a strategy for scaling and optimizing a Git repository, including Scalar and cross-repository sharing
- Implement workflow hooks

Plan and implement branching strategies for the source code
- Design a branch strategy, including trunk-based, feature branch, and release branch
- Design and implement a pull request workflow by using branch policies and branch protections
- Implement branch merging restrictions by using branch policies and branch protections

Configure and manage repositories
- Integrate GitHub repositories with Azure Pipelines, one of the services in Azure DevOps
- Configure permissions in the source control repository
- Configure tags to organize the source control repository
- Recover data by using Git commands
- Purge data from source control

Design and implement build and release pipelines (40–45%)

Design and implement pipeline build automation
- Integrate pipelines with external tools, including dependency scanning, security scanning, and code coverage
- Design and implement quality and release gates, including security and governance
- Design integration of automated tests into a pipeline
- Design and implement a comprehensive testing strategy
- Implement orchestration of tools, such as GitHub Actions and Azure Pipelines

Design and implement a package management strategy
- Design a package management implementation that uses Azure Artifacts, GitHub Packages, NuGet, and npm
- Design and implement package feeds, including upstream sources
- Design and implement a dependency versioning strategy for code assets and packages, including semantic versioning and date-based
- Design and implement a versioning strategy for pipeline artifacts

Design and implement pipelines
- Select a deployment automation solution, including GitHub Actions and Azure Pipelines
• Design and implement an agent infrastructure, including cost, tool selection, licenses, connectivity, and maintainability
• Develop and implement pipeline trigger rules
• Develop pipelines, including classic and YAML
• Design and implement a strategy for job execution order, including parallelism and multi-stage
• Develop complex pipeline scenarios, such as containerized agents and hybrid
• Configure and manage self-hosted agents, including virtual machine (VM) templates and containerization
• Create reusable pipeline elements, including YAML templates, task groups, variables, and variable groups
• Design and implement checks and approvals by using YAML environments

Design and implement deployments
• Design a deployment strategy, including blue/green, canary, ring, progressive exposure, feature flags, and A/B testing
• Design a pipeline to ensure reliable order of dependency deployments
• Plan for minimizing downtime during deployments by using VIP swap, load balancer, and rolling deployments
• Design a hotfix path plan for responding to high-priority code fixes
• Implement load balancing for deployment, including Azure Traffic Manager and the Web Apps feature of Azure App Service
• Implement feature flags by using Azure App Configuration Feature Manager
• Implement application deployment by using containers, binary, and scripts

Design and implement infrastructure as code (IaC)
• Recommend a configuration management technology for application infrastructure
• Implement a configuration management strategy for application infrastructure, including IaC
• Define an IaC strategy, including source control and automation of testing and deployment
• Design and implement desired state configuration for environments, including Azure Automation State Configuration, Azure Resource Manager, Bicep, and Azure Policy guest configuration

Maintain pipelines
• Monitor pipeline health, including failure rate, duration, and flaky tests
• Optimize pipelines for cost, time, performance, and reliability
• Analyze pipeline load to determine agent configuration and capacity
• Design and implement a retention strategy for pipeline artifacts and dependencies
Develop a security and compliance plan (10–15%)

Design and implement a strategy for managing sensitive information in automation

- Implement and manage service connections
- Implement and manage personal access tokens
- Implement and manage secrets, keys, and certificates by using Azure Key Vault, GitHub secrets, and Azure Pipelines secrets
- Design and implement a strategy for managing sensitive files during deployment
- Design pipelines to prevent leakage of sensitive information

Automate security and compliance scanning

- Automate analysis of source code by using GitHub code scanning, GitHub secrets scanning, pipeline-based scans, and SonarQube
- Automate security scanning, including container scanning and OWASP ZAP
- Automate analysis of licensing, vulnerabilities, and versioning of open-source components by using WhiteSource Bolt and GitHub Dependency Scanning

Implement an instrumentation strategy (10–15%)

Configure monitoring for a DevOps environment

- Configure and integrate monitoring by using Azure Monitor
- Configure and integrate with monitoring tools, such as Azure Monitor and Application Insights
- Manage access control to the monitoring platform
- Configure alerts for pipeline events

Analyze metrics

- Inspect distributed tracing by using Application Insights
- Inspect application performance indicators
- Inspect infrastructure performance indicators, including CPU, memory, disk, and network
- Identify and monitor metrics for business value
- Analyze usage metrics by using Application Insight
- Interrogate logs using basic Kusto Query Language (KQL) queries
