## Overview

Dynamic case configuration template provides solution right away for any kind of business. Any requirement which involves multiple transactions, steps, stages etc. like banking services, claims processing, HR services and anything which rotates around customer relationship management can think out of the box to change their business and adopt to this pattern for more dynamic usability.

# Features

Unified Interface is the new metadata driven client interface that is designed to provide a consistent experience across devices and form factors. It provides users a consistent, accessible, uniform user interface, and follows responsive design principles for optimal viewing on any screen size or device. This application is designed to work in UCI. A model driven application named "DynamicCaseTemplate" will be installed along with the solution. Open that application as shown in below screenshot.

This tool is available as a solution and we need below master data to be filled as a pre-requisite:

- 1) Master Template Configuration -Mandatory
- 2) Master Forms -Optional
- 3) Master Documents -Optional
- 4) Master Steps -Optional

## 5) Master Letters –Optional

After creating the master data, we will use this master template in cases which will automatically populate the forms, letters, documents that have been added in the template into the case as sub grids.

Entities under case:

- 1) Forms
- 2) Documents
- 3) Steps
- 4) Letters

Now we will look into each entity:

## Master Template Configuration

This entity is the parent entity for all child master entities.

First, we need to select BPF for the Template:

The screenshot shows the 'New Master Template Configuration' form. The top navigation bar includes 'DynamicCaseTemplate' and various icons. Below the navigation bar, there are tabs for 'General', 'Forms and Letters', 'Documents', 'Steps', and 'Stage Queue Mapping'. The 'General' tab is active. The form contains several input fields: 'Template Name' (required, marked with a red asterisk), 'BPF', and 'Apps Type'. To the right, there is a section titled 'Administration Section' with an 'Update BPF Config' checkbox.

Since we cannot take OOB business process flows as a lookup, we have provided the custom business process flow. We need not create stages manually in this custom business process flows. When we create new master template configuration on load JS function will verify if any OOB BPFs are created, if any created it will create custom BPF with same name stages in and show it in the BPF lookup.

# New Master Template Configuration

**General** Forms and Letters Documents Steps Stage Queue Mapping

Template Name *	<b>Test Template</b>	Administratio
BPF	<input type="text" value="Look for Business Process Flc"/>	
Apps Type	<div><div><p> Case to Work Order Business Process 6/12/2019 12:22 PM</p><p> Phone to Case Process 6/12/2019 12:22 PM</p></div><div><p><a href="#">+ New</a> <a href="#">Change View</a></p></div></div>	

After selecting the BPF we can select app type and save the form. Apps type is a custom lookup field where you can mention the type of template. This is to identify the type of template.

Now we will be able to create/add the sub entities for the Master template Configuration.

## Sub Entities adding to Master template:

### Master Forms

Add Master forms to the master template configuration.

Click on (+) symbol and click on new as shown below and enter the required fields and save the form. Now the form will be added to the Master template configuration. The process of creation of new master form is discussed later in this document. You can customize your own custom entity and open that entity form as your Master form.

## Creation of New Master Form:

- 1) As shown in below screenshot, we need to give the Form Logical Name and Crm Form Id of the entity and the entity form respectively. Please follow below steps to fill these fields

General	
Name	* ---
Form Type	* Master Form
Usage Type	Mostly
Version	1.0
Form Logical Name	---
Crm Form Id	---
Description	---
OrgURL	https://appsourcejune.crm.dynamics.com
Status	* Active

You can use already existing entity or create a new entity as shown below. Copy down the name field of that entity (for below e.g. "**new\_customerdemographics**"). (Any prefix is fine)

The screenshot shows the 'Entity: New' configuration page in Microsoft Dynamics CRM. The 'Name' field is highlighted with an orange box, containing the value 'new\_customerdemographics'. Other fields include 'Display Name' (Customer demographics), 'Plural Name' (Customer demographics), 'Primary Image', 'Color', 'Description', 'Virtual Entity', 'Data Source' (None), 'Ownership' (User or Team), 'Define as an activity entity', and 'Display in Activity Menus'. There are also checkboxes for 'Areas that display this entity' (Sales, Training, Service, Portals, Marketing, Community, Settings) and 'Process' (Business process flows). The 'Communication & Collaboration' section includes checkboxes for 'Feedback', 'Notes (includes attachments)', and 'Activities'.

Create all the fields required in the form and along with them create a field named "prefix\_caseformid" as **lookup** of **app forms** entity.

**Display name:** caseformid

**Name:** prefix\_caseformid (replace prefix with your entity prefix)

**Datatype:** Lookup

**Target Record Type:** App Forms

Field: New for Customer demographics - Google Chrome

Summary Forms and Letters Documents Steps Related

CASE DETAILS	
Case Title	* TAO
ID	CAS-01003-F7K0Z6
Template Name	Test1
Customer	* Deepthi NCL

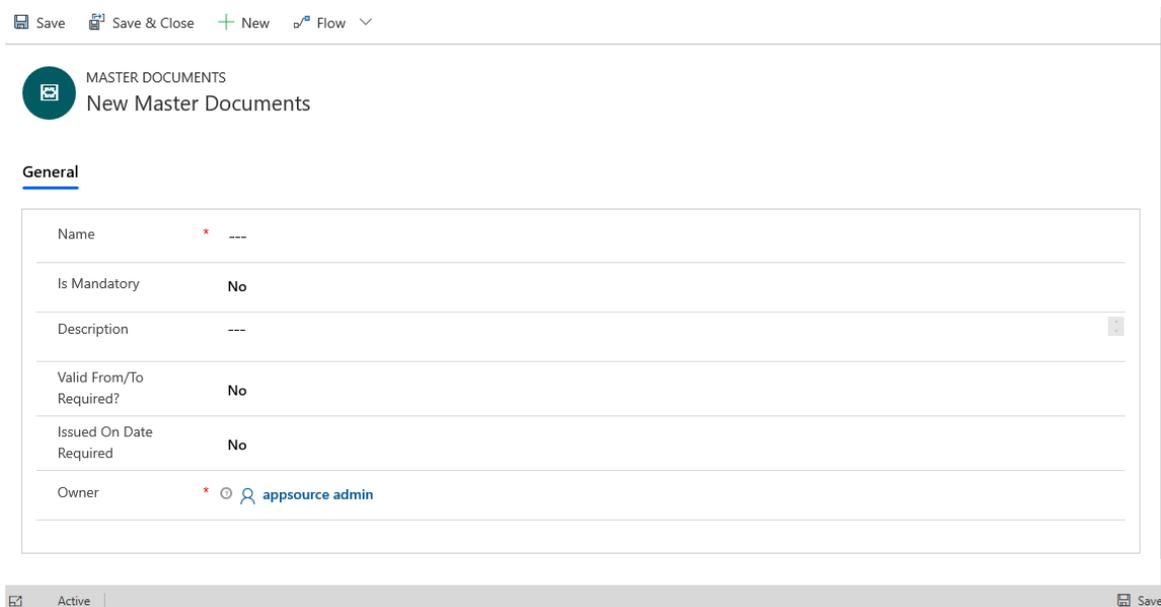

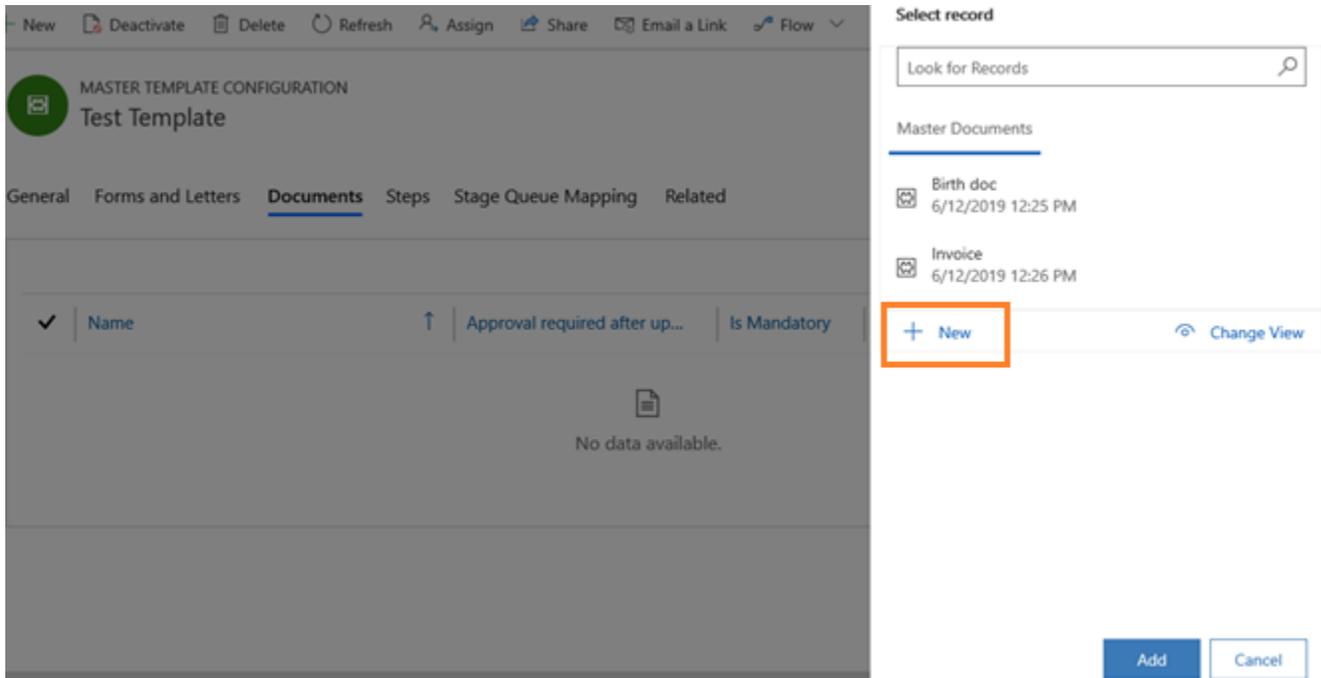

A master form record with same name will be created here. Select that record as shown below. It will open the related entity form.

The screenshot shows the Microsoft Dynamics 365 interface. On the left, the 'Forms and Letters' section is active, displaying a list of forms. The 'CUSTOMER DEMOGRAPHICS' form is selected. In the center, the 'Master Entities' list is open, showing 'CUSTOMER DEMOGRAPHICS' as the selected entity. On the right, the 'Customer demographics' form is displayed, showing the 'Name' field with the value 'Customer demographics' and the 'Owner' field with the value 'DT Call Creator'.

## Master Documents

Add Master Documents to the master template configuration.

Click on (+) symbol and add an existing document or click on new if you want to create a new master document as shown below and enter the required fields and save the form. Now the document will be added to the Master template configuration.

## Master Step Config

Add Master Step Config to the master template configuration.

Click on (+) symbol and click on new as shown below and enter the required fields and save the form. Now the form will be added to the Master template configuration.

Master Step Configuration is an intermediate entity between Master steps and master template configuration.

Master Steps is an Entity where we are maintaining the general information of the step like step name, Queue, Step Stage and Step type.

## Master Steps

Save Save & Close + New Flow

### MASTER STEPS New Master Steps

#### General

Name	*	---
Queue (User or Team)		---
Step Stage		---
Step Type	*	---

After filling the details in master steps, we will select the same master step in master step Config to add and save.

### MASTER STEP CONFIG Test Master step

#### General Related

Step title	*	Test Master step
Master Template Configuration	*	Test Template
Steps name	*	Test Master step
Step Order		1.00

## Master Letters

Master Templates are document templates of OOB CRM. Create a document under document template and with the same name, we must create a master letter in master letters entity.

We should use only Microsoft word document to use for the Master Letters. Also, we can customize the word document as per business requirement.

DOCUMENT TEMPLATE : INFORMATION  
TestTemplate

General

Details

Status	Activated
Name *	TestTemplate
Description	< [REDACTED] >
Type *	Microsoft Word
Modified On	4/29/2019 3:56 PM
Modified By	test user3
Associated Entity Type Code	Case
Created By	test user3
Created On	4/29/2019 3:56 PM
Language *	English

After creating OOB document we should use same name to create master letters to reflect this document as an attachment under Case Letters.

Under Master template configuration we will provide only name of OOB document template for the master letters and save.

1 - 4 of 6 (0 selected) Page 1

Now we have created a master template with all the master records like master forms, master documents, master steps and master letters. Now we are ready to create app documents, app forms, app steps and app letters under the case. We can create a case by selecting the template which creates a case with all the required sections. This pre-defined template-based solution is configured and used for any type of need and can be widely used and can be customized.

Below are the steps to use the template configuration.

Go to Service → Case → New Case

Select “**App\_case**” form when case is opened. Fill all the mandatory fields and select the master template configuration lookup. On saving the case, app documents, app forms and app steps will be created.

CASE

Test case

Case to Work Order Busi...

## Clone Master Template Configuration:

This is a new feature in Dynamic Case Configuration where we can copy the same master Template with all master Data to another template and also, we can modify (add/remove) the latter as per our requirement.

To Clone/Copy the master template configuration we need to provide unique name for newly created master template configuration.

[Stage Queue Mapping](#)
[Related](#)

Template Name	<b>Test Template</b>
BPF	<a href="#">Case to Work Order Busine...</a>
Apps Type	---

**Administration Section**

Copy Master template Config  Update BPF Config

---

New Master Template Config Name **New Clone**

To create clone of master template, we need to open existing master template configuration record and check the 'Copy Master Template Config' check box. Then it will ask for new unique master template configuration name. Providing name and save the form will create clone/copy of the master template configuration. To see newly created master template, go back to master template configuration main grid and refresh.

## Active Master Template Configuration

Name	Created On
New Clone	6/20/2019 2:32 PM
Test	6/12/2019 12:22 PM
Test Template	6/20/2019 12:23 PM

Now you can see the newly created master template configuration is cloned from another master template configuration.

## Update BPF Configuration

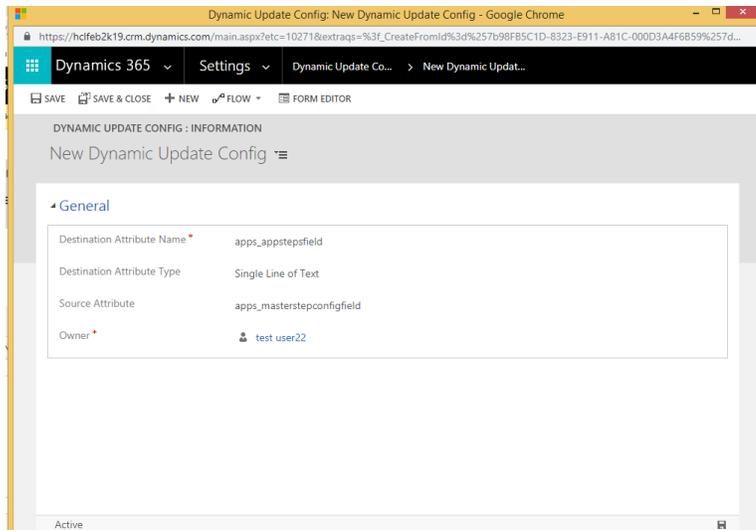

Update BPF configuration is another feature when we create new BPF and if it is not update in the master template configuration BPF lookup , then we can force to update the lookup by checking the 'Update BPF Config lookup' checkbox. This will update the all newly created BPF and update the BPF lookup of under master template Config.

# Dynamic Code Config

If you want to update any field value in app steps entity (steps created in the case) with the value of any field in master steps config entity. Then create a dynamic code config record and add required fetch xml in "Retrieve Fetch XML" field as shown below:

Add a dynamic update config record. Click on (+) symbol and click on new as shown below and enter the required fields and save the form. Destination attribute is the attribute that you want to update in the app steps. Source attribute is the attribute in master step config entity. The value of source attribute will be updated in the destination attribute.

## Sample Code:

```
<fetch version='1.0' output-format='xml-platform' mapping='logical' distinct='false'>
  <entity name='apps_masterstepconfig'>
    <all-attributes />
    <order attribute='apps_name' descending='false' />
    <filter type='and'>
      <condition attribute='apps_mastertemplateconfigurationid' operator='eq' value='{0}'/>
    </filter>
  </entity>
</fetch>
```

**Note:** Go to Processes in the solution after installation and check if all the processes present in the solution are activated. If there are any processes related to Dynamic case template solution which are in draft status, go to Settings → Processes and activate them.

End of Document
