FIELD VALIDATION

Field Validation for Microsoft Dynamics 365 Business Central

The Field Validation App provides the solution for implementaing flexible data quality business rules for all your master data. We enable you to set up a more reliable Dynamics 365 Business Central environment.

Many companies have a daily struggle with keeping their (master) data reliable. In many cases, incomplete or incorrect master data leads to errors in daily processes, often costing a lot of time, money and resources to solve.

The Field Validation App enables you to make sure the data is correctly and completely entered at the source. thereby your core business processes run smoothly.

Setup data quality buisness rules on every table, even with related tables

With a decent setup of data quality rules on your master data you can enhance the reliability of the automated information processing of your organization.

• Easily setup validation rules for every field, like mandatory, filter or length rules.

• Field Validations are subject to conditions, so you can perfectly control when the data has to be validated.

• Conditions can be setup on related tables, which gives a huge advantage in controlling the validation moment.

• Validations can also be setup on related tables.

•You can validate the default dimension setup at master data level.

• You can setup init values for records so the conditions are initially setup (like blocking an item on insert).

• For existing records, you can easily check if these records match the newly setup validation rules.

How it works

The Field Validation app validates on record level. If necessary, you can setup specific validations per company or per permission set (and thereby per user). Furthermore, we deliver default dozens of table relations to get you going. All can be up and running within a day.
