FIELD SECURITY

Field Security for Microsoft Dynamics 365 Business Central

The Field Security App provides the solution for implementing segregation of duties by setting up authorizations on field, filter and action level.

We enable you to setup a more secure and compliant Dynamics 365 Business Central environment.

## Refine your authorizations up to field & filter level

With a decent authorization setup on field, filter and action level you can enhance the security and internal control of your organization.

With the Field Security App you are able to:

• Easily refine authorization up to field and action level.
• Authorize groups of users to filtered records for editing or viewing.
• Allow initial filling of fields in order to enable usage of master data templates.
• Segregate permissions for tables that are used to multiple tasks.
• Refine and optimize your authorizations.
• Authorize on almost every action in Microsoft Dynamics 365 Business Central.

How it works

The Field Security app secures up to field, filter and action level. Because of linking to permission sets, complete flexible setup is enabled. Settings "modify all fields except" or "modify no fields except" can be selected. Users do not have to maintain extra security controls. Furthermore the app offers the possibility to hide records on a page.
