

Identity Protect

Backup, rollback and recover hybrid identities

Safeguarding your identities has never been easier

There are situations with Azure Active Directory and Active Directory where you can lose information about directory objects or even the whole objects themselves. The directory restore process can be time consuming and complex. In the event of many Azure Active Directory objects there is no recourse as certain object deletion is permanent and soft recovery requires manual steps to rebuild properly. In comes our solution that provides incremental backups and granular restores. We make it easy to pinpoint changes to your identity objects and return them to the desired state.

Some prime use cases

- ❖ A user was deleted on-premises and had hybrid identity with Azure Active Directory. With just a few clicks both Active Directory and Azure Active Directory objects are brought back, reattached to their cloud mailbox and had attributes including group memberships restored.
- ❖ Some changes were made to directory objects that is impacting users and services. Using Identity Protect's advanced search functions you can see what changes have been made to objects in a specific time frame all the way to the very first baseline backup taken. The change is found and reversed in minutes.

Our assessment includes:

- ✓ **Incremental Backups** of both Azure Active Directory and their Active Directory counterparts
- ✓ **Advanced Search** capabilities for changes and objects at the attribute level
- ✓ **Recover** both soft and hard deleted objects
- ✓ **Rebuilds** group memberships and attributes lost
- ✓ **Granular Restore** options allow you to restore a change event rather than everything point in time
- ✓ **Empower** operational teams to manage hybrid identity state

Do granular searches with advanced filtering

The screenshot displays the Identity Protect web application. On the left is a sidebar menu with options: Home, AAD - Users, AAD - Groups, Groups, Deleted Groups, AD - Users, AD - Groups, AD - Contacts, Backups, and Configuration. The main panel is titled 'AAD - Groups' and features a search bar and a table for filtering. The table has columns for Attribute, Condition, and Value. Below the table are buttons for '+', '-', and a 'Restore' button. At the bottom right, there are buttons for 'Show Backups', 'Search', and 'Reset'.

PresideTech is your trusted technology advisor

Enabling scalable, long term growth for your company requires forward-looking IT solutions tailored by people with the right experience. Our mission is to provide better vision and guidance to companies seeking to operate more securely and efficiently with enhanced productivity. We look beyond static solutions and build a roadmap with you to continually drive your growth and evolution.

We strive to create a long term, trusting relationship with each client to provide an environment that simplifies and secures the way the organization leverages technology, creates a cohesive portfolio of services, derives the most value from investments, and keeps in stride with the fast-changing global technology landscape.
