
Disaster Recovery Trial in Azure

Overview:

The DR trial gives you the ability to test Microsoft Azure's capability to protect workloads and simulates a disaster recovery scenario, so you can assess Azure's effectiveness as part of a DR and business continuity plan. As part of this trial Foundation IT will:

1. Setup your Azure Tenant
2. Protect a workload using Azure Site Recovery (ASR)
3. Simulate a Disaster Recovery scenario and fail over to Azure
4. Compile a report on DR simulation exercise

Outcomes:

As part of the trial, we will deliver:

- A working and tested Disaster Recovery as a Service platform
- An assessment report outlining the performance of the DR simulation
- Recommendations for optimising DR and business continuity approach

Benefits:

Leveraging public cloud for disaster recovery and business continuity, reduces the cost and complexity involved in running a secondary data centre site. Our clients have seen a number of benefits by adopting cloud based platforms including:

- Reduced or removed secondary data centre costs
- Improved resiliency for businesses who lack DR facilities
- Maintained continuity of service in the event of a system failure
- Exposure to key Azure services
