UNITOP ERP MANUFACTURING - ALL THE TOOLS THAT YOU REQUIRE - IN ONE PLACE!

The challenges faced by industrial enterprises today are multi-layered. One of these challenges, for example, is the growth in customer requirements. Customers not only require ever more cost-efficient and high-quality products, but also ever shorter delivery times.

An additional challenge is globalization and increasing international competition. Only those companies that adapt to the new requirements in a timely manner will be able to hold their own successfully in national and international competition.

An increasingly large number of variants, falling batch sizes and seamlessly interlocking work processes – the requirements in the manufacturing industry are also continually increasing. Many manufacturers need to take their customers' individual requirements into account as early as the quotation phase. Especially in the case of complex and challenging production processes, clear agreements are important from the very outset.

Particularly in the case of the manufacture of very different products and items, a relatively large workload is often involved, coupled with high requirements on costing. In such cases, it is important for the software to meet the requirements. Keeping track is crucial: from quotation to costing through to delivery.

The current organizational processes can frequently no longer be modelled in a manner that satisfies requirements using IT systems and software solutions that are usually several years old. Many companies come to terms with this situation – to the detriment of efficiency. Most software solutions in the age of "industry 4.0" no longer meet current technical possibilities. That means: potential is often not maximized.
