Database Review

xTEN

⚠ Are you falling victim to performance problems without any insight or explanation?

⚡ Is your current SQL Server backup and disaster recovery strategy operational and robust enough to meet the requirements of your business?

<> Are you confident your estate is configured according to best practice and taking advantage of all that SQL Server has to offer?

Our Database Review is your first step to **stronger**, **faster** and **smarter** systems.

Understand your concerns

Our database review provides a detailed insight into the health of your databases, instances and supporting hardware. We begin the process with a discovery call where we aim to understand any current concerns and any plans for the system. You may be looking to improve the performance of your services, increase throughput, eliminate system freezes, or internal locking. Understanding these objectives, coupled with the strategic goals of your IT team, will help our engineers to tailor the report to your needs.

Find solutions to your problems

Once our team understand your goals and expectations from the review, they perform an in-depth inspection of your database instance(s) and supporting infrastructure using our custom-built applications and non-invasive scripts. This information is then analysed, categorised and collated into a single report which provides a simple overview of the issues found and how to address them.

Give you a clear path forward

Our reports cover the most critical areas of database management, including performance, security, stability, data integrity, infrastructure, licensing and possible cost-reductions; which are ordered by importance with clear explanations. Once you have had time to review the report, we will conclude the assessment with a call where we answer any questions and provide guidance on how to implement them.
