

# SQL Server Migration: 4-Week Implementation

The SQL Server Migration Implementation is the continuation of the 3-Day Assessment where we will carry out the plan to move your on-premise database to Microsoft Azure. Our engineers will implement the established plan and will ensure that your SQL workloads run flawlessly in Microsoft's cloud environment.

## Scope of work

- Meeting with client to plan the implementation timeline, roles, and responsibilities.
- Review with the client, all suggested architecture and cloud services needed.
- Test migration with a small-scale database and environment (if possible). Determine possible issues with the implementation and adjust the plan to correct them.
- Migrate the database to Azure.
- Security and performance assessment.

## Deliverables

- New cloud environment for SQL Server workload.
- Scripts, credentials and any documentation relevant to the new cloud environment.

## Notes and Assumptions

- Azure subscription provided by client. If none available, we can help setting it up.
- The database is up to 50GB in size.
- Additional services available: support, large environments, etc.
