

# Datacom Enabling Services

**Standardise, Automate and Securely deliver business grade applications on Microsoft Azure.**

Datacom, as a Microsoft certified Azure Expert managed Service provider (MSP), have been audited and accredited as an expert in delivering and managing Azure Environments across the globe.

Datacom delivers a holistic approach to your Microsoft Azure environment from the initial Strategising to Design, Build and then the ongoing Operation.

## Datacom Enabling Services

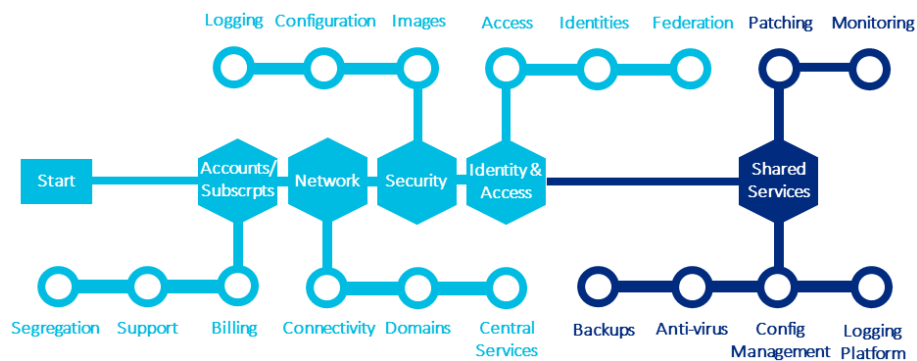

Our Operate function provides efficiency and automation of low-value operational activities. Datacom Enabling Services, our Azure Expert MSP platform, delivers a standardised, secure and certified platform that is backed up with skilled resources delivering a full environment Managed Service. It delivers a highly automated and scalable managed solution for both IaaS and PaaS environments.

Datacom's public cloud support model is premised on the concept of enabling services for cloud. The role of enabling services is to provide a consistent, governed and endorsed "best practice" managed cloud environment.

It allows organisations to be secure with Hybrid Cloud, benefiting from the scale, security and expert skillsets available via Datacom's managed platform, which is designed to meet their business and development needs. The basic premise is that no matter what occurs in the cloud environment, be it network, infrastructure, platform or software as a service, the following principles will apply:

- Secure – cloud platform actions are logged and controls are in place.
- Compliant – ensuring services are protected and compliant with cost and finance allocation policies.
- Transparent & Unhindered – developers and users are enabled to utilise public cloud in the way intended, without being constrained by undue process and approval layers.
- ITIL aligned – ensures all ITIL configuration, change and release processes occur.
- Consistent – ensures consistency across development, testing and production environments and customers, in-line with cloud principles.

Datacom's Enabling Services is made up of the following two components: a landing zone and shared services.

The **landing zone** defines the foundational elements required before migration or deploying any infrastructure/applications on Azure and includes subscriptions, networks, security and identity & access management.

**Shared services** are those services generally required by the majority of infrastructure and applications to function and be governed appropriately. These include backups, monitoring, logging, patching and configuration management.

Datacom Enabling Services is a consumption-based service.
