Azure Migration Planning

Discovery, analysis and planning for your cloud journey

KCOM's Cloud Migration Planning helps organisations plan for the transition from their existing IT infrastructure to Azure.

- Assess the overall technical viability of migrating your environment to Azure

- Catalogue priority workloads for migration

- Measure the Azure readiness of the priority workloads

- Recommend a pilot workload for migration

- Determine a suitable process for the migration

- Estimate the time needed to discover, assess and plan the migration of the remainder of the estate

Our KCOM Cloud Architects will work with your subject matter experts and business and technical stakeholders. We will use migration tooling to assist with the discovery and analysis process.

KCOM will provide a report containing our findings. This will include our assessment on the overall viability of a migration to Azure, suggested priority migration workloads, recommendations on the migration process and next steps.

Following the completion of this engagement KCOM provide a range of related cloud services including Azure Landing Zone design and build, workload migrations, application modernisation and 24 x 7 in-life support of your Azure environment.

Benefits of KCOM's Azure Migration Planning service:

- KCOM provide a quick start approach to migrating your existing workloads to Azure

- We bring our experience from the complete cloud life-cycle – we plan, build/migrate and run cloud environments

- We provide both lift and shift migrations and application modernisation (to help you make the most of Azure)
