

Bringing agility, innovation and scale to your business

Running applications on an aging IT infrastructure can present a variety of business challenges. From time-consuming application changes to the costs of scaling, it's no surprise that organisations are migrating to the cloud.

Having made the decision to move to a cloud infrastructure, organisations must form a strategy to migrate their applications. A 'lift and shift' approach to Microsoft Azure can offer significant benefits, but the true value is seen when applications are modernised to utilise Azure platform services.

Through our approach, we help drive application innovation and modernisation using the latest Microsoft solutions. We apply repeatable patterns to help accelerate modernisation, maximise agility, reduce risk and achieve scale faster.

Our team of experienced cloud architects and developers work with organisations to refactor, rearchitect or rebuild their applications to get the most from their Azure environment. Today and in the future.

Benefits of Application Modernisation:

- > Unleash cloud agility and innovation
- > Reduce your Total Cost of Ownership
- > Scale your application using Azure managed services
- > Identify and scale the parts of your application that matter
- > Utilise platform as a service components
- > Quickly deploy new applications

Application Modernisation Services:

Maximise agility

Transform your existing applications to enable cloud agility and innovation.

Scale

Reduce reliance on aging infrastructure. Use Azure managed services to scale your applications.

Modernise

Identify whether you need to refactor, rearchitect or rebuild your applications.

The way we work

Our Application Modernisation Services are underpinned by our Azure DevOps approach. We apply a DevOps mindset and tooling to the build and delivery of our solutions: automation, repeatability and monitoring are prominent themes throughout the process.

Our templated approach is shaped by our experience. We get your applications up and running faster, while teaching your teams to build their own delivery pipelines using the same proven processes.

A cloud strategy should never be treated as 'done'. It's important to continually review and assess the performance of your applications and infrastructure to ensure they remain optimised. Our teams can manage your Azure environments in-life, or work with your own teams, to ensure they have the support they need.
