

Your agile software development benefits of the functionality and take advantages of the Azure DevOps Services.

For your requirement management, your company uses Jama Connect to ensure continuous quality improvement, a reduction in rework and faster time-to-market.

In the Azure DevOps Services <-> Jama Connect interconnection workshop you will learn the possibility of automatically connecting the two tools regarding import / update of requirements and design description from Jama Connect to DevOps boards, as well as updating the DevOps status to Jama Connect. This means that no leading system has to be changed, since the data is updated bi-directionally automatically.

The interface fully runs in Azure. No additional products need to be used. You can easily add more interfaces (e.g. SAP). Communication is fully encrypted (https) and uses Azure Key Vault.

With the knowledge you get in this workshop and the information you give us regarding your requirements, we will submit you an offer for your Azure DevOps Services <-> Jama Connect interconnection and also implement the Interface based on your requirements
