How companies are leveraging Zero Trust to secure devices

In the current landscape of remote work, enterprises are realizing the need for a Zero Trust security model to manage the increasing number of personal devices accessing their corporate networks. This approach requires a multi-layered approach to security, where IT leaders are focused on ensuring device health and compliance before granting access to corporate resources. According to a survey of IT leaders, 92% believe their current security tools and policies are insufficient to protect devices managed by employees. The same survey highlights that 70% of IT leaders have created a mobile device management (MDM) solution to complement their existing security technologies.

Microsoft Endpoint Manager is the MDM solution that is designed to secure devices managed by employees. This solution helps enterprises enforce critical Zero Trust controls and prevent potential security threats.
