Each cloud adoption project has a clear-cut start, but given the dynamics of the industry today, no organization should ever consider their cloud journey complete. It demands continuous learning, adjusting, and refining. Moreover, the overall success of cloud adoption depends on and impacts non-technical areas of an enterprise, which many organizations tend to overlook. Organizations that thrive on their cloud journeys understand the scale-up and skill-up efforts needed on their various teams. They also have a clear vision on how to adapt their ways of working to succeed a complex emergent environment.

In this engagement, we help you design a cloud adoption roadmap, including a detailed schedule of workshops and deliverables needed at various stages of the journey. We apply the Schuberg Philis proven cloud adoption framework, but zoom in on each customer's specific context, business goals, and focus area or industry.

We help you:

- Establish stakeholder alignment on objectives, desired short-term and long-term outcomes, and budgets
- Evaluate what work is needed to develop a cloud operating model
- Indicate which topics of a high-level technical design are required to get started
- Evaluate team readiness and sketch a scale-up/skill-up roadmap
- Assess the existing IT landscape and suggest a roadmap for a brownfield migration or a greenfield deployment for individual workloads or teams

After creating a cloud adoption journey roadmap, the next step we recommend is our custom cloud operating model development.
