

Harness the power of your Data

Large organizations' business data is often spread across dozens of divisions and several information systems normally defined differently so that when combined across systems, lead to undesired results. These data integrity and quality issues will persist without proper management of master data— information that describes core business entities such as customer, supplier, location, or product.

Master data is a critical step for companies to aligning information with business objectives and processes. It provides the means for synchronizing data across business units and applications for the greater good of the enterprise.

To get your master data on track and make sense of a growing and converging marketplace of vendors and tools, we offer our customers a 4 day workshop with a dedicated focus on Finance Services, Manufacturing, Retail and Healthcare industries.

Our approach helps you to define the governance and stewardship organizations and processes needed to manage and share information across your business effectively utilizing one of the leading systems within Gartner's leaders' quadrant, thus enabling you to;

- Define means to generate a single version of critical reference data shared internally and externally
- Leverage on ways to improve business intelligence with true global reporting
- Ensure definition of steps required to achieve operational efficiencies and save costs by capturing data once, correctly and completely, according to data standards
- Ensure compliance and manage risk by defining means to extend

knowledge of your suppliers, products, chart of accounts (ledger), customers, and more

- Enable you build hierarchies for a more complete view of all your business relationships

MDM initiatives can be unwieldy and overwhelming, our workshop shall enable you build a plan that benefits the broader organization, while incrementally building out high-value areas. This helps you manage risk and cost, while generating momentum for a more expansive MDM program.

Why QS2?

Quality Software Solutions track record and expertise in managing large-scale data integration projects and global MDM solutions, bring structure and experience to your data initiatives and business data. Deep technical understanding of data integration, combined with industry expertise, enables us to deliver a strong solution with focus on both business and technical aspects.

We support you through all phases of the MDM lifecycle, from building your strategy through implementing and supporting a solution. You benefit from best practices generated over 15 years of experience delivering data management solutions in large, multinational environments. Additionally, our MDM competency center offers offshore delivery options that give you even more control over the budget and schedule of your projects. Our consultants are skilled in the leading MDM tools and provide unbiased guidance, by choosing the right product to integrate with your current environment and meet your business needs.

Book a workshop today and enjoy your Golden record journey.
