

Backup & Restore in Single dashboard

This IMAP email backup and restore tool is developed with an advanced algorithm, and users can do both tasks (Backup & Restore) in a single dashboard. The dashboard is where you can find all the information related to the backup and restore process.

Advance Settings

The software has advanced options of Mailbox Thread Count and Item thread count. The advanced setting option comes in handy to increase the processing speed effectively.

Mailbox Thread Count: This option allows you to run multiple threads for each backup job.

Item Thread Count: With this option, users can set multiple threads for each IMAP mailbox.

Scheduler

Generally, users prefer to backup IMAP emails during the weekends or on their free schedules. The Shoviv IMAP backup tool has a convenient Scheduler feature that allows users to run the backup process at a specific time or concurrently. With the help of the scheduler feature, users can schedule the backup process on a daily, weekly, and monthly period.

Split Backup Files

The software backups IMAP emails in PST format. As we are aware, Outlook has a PST file size restriction. For this, the software offers a handy split feature. Using the split option, users can select the desired size for PST files, and the software will automatically create PST files of that size.

Prevent Duplicity

Process interruption is one of the worst scenarios while restoring PST to IMAP mailboxes. But with the Shoviv IMAP email backup tool, users get a facility to restart the interrupted process and prevent exporting items, which were already exported. It will save users costly time and prevent duplicity in the target mailbox.

Backup IMAP to PST

Basically, IMAP is an email server where users can configure different domains of emails. But as we all know, nowadays, data breaching and ransomware is a big headache, and almost every professional wants to keep their data on a local disk. With the Shoviv IMAP email backup software, users can effortlessly backup IMAP to PST format and store PST files in the desired & secure location.

Create multiple backup jobs

Shoviv utility to backup IMAP emails allows users to create multiple IMAP backup jobs. Creating multiple jobs will run the backup process concurrently, and it will save time and effort. Also, by doing this, Users can backup a large number of IMAP mailboxes without extra effort. The backup jobs don't make any impact on the users as software also works in the background.

Filter unwanted emails

Users have the right to decide which data to backup. For this, the IMAP email backup software has a filter option. Users can include/ exclude IMAP emails on the date range and folder filter criteria. For this, select a date range or add folder names and select whether you want to include or exclude these date range and folders' items.

Default Incremental

Shoviv's utility to backup IMAP mailboxes has a default incremental feature that always works in users' favor. In case your backup process stops due to any reason, then you can simply resume or restart it from the interface. Incremental features maximize the backup speed and reduce storage space.

Create multiple Restore Jobs

Same as the backup jobs, users can also create multiple IMAP restoration jobs. The best thing about multiple job creation is users can monitor all the restoration jobs in a single dashboard. And can switch between any jobs to see the complete processing detail of any job.
