

# Azure Quick Sizer for SAP

## A quick fix for a familiar problem

Identifying right sizing for AZURE infrastructure components (Virtual Machines, Storage Disks, Network Bandwidth etc.) for large SAP landscapes and multi-tier environments is often complex and time-consuming with different options to optimize and rationalize requirements with respect to HANA large instances, virtual machines, database, and operating systems.

What if there was a way to churn out the infrastructure cost and suggested component configuration in a matter of minutes?

The TCS Microsoft Business Unit has developed a Quick Sizer accelerator that can simplify and accelerate Azure sizing and quickly deliver accurate results.

## About the Quick Sizer

TCS' Quick Sizer is built using native programming technologies like MySQL, Angular & Java to deliver an accelerated Azure estimate. Azure Architects can then use this to supplement cloud transformation discussions.

The application features:
