Account recovery and password resets are time-consuming for everyone. With a solution that uses Microsoft Entra Verified ID to easily create and verify identity credentials, your users can become empowered to manage their account and password recovery themselves using self-service—saving IT teams time and resources and getting users back to work faster.

Benefits

Verifiable ID allows you to reduce support phone calls and so security questions with a secure, straightforward process to verify identity. Some of the organizational benefits of verifiable credentials include:

- Faster account recovery and password reset. Reduce the amount of time spent resetting passwords and managing accounts to save your organization valuable time and money.
- Immediate visibility of status change. Keep systems secure with easily managed status changes, such as expiration or credential revocation, visible to all partners and verifiers. This leaves individuals in control of their data even if they no longer have access to your network.

How it works

Verifiable ID can help people regain access to their locked accounts quickly, without revealing personal information over the phone or in person. The example below illustrates how an employee or customer of the fictitious company Woodgrove could request proof of identity with a verifiable credential. When the account holder chooses “Verify my identity,” a permission request arrives in their digital wallet to verify that specific microcredentials (for example, name, address, and birth date) verified by the fictitious ID verification company True ID match the person’s record at Woodgrove. The person can choose to allow this verification, which allows Woodgrove to trigger a password reset based on security policies.

Sample scenarios for self-service account recovery

Here are a few examples of how self-service account recovery could be integrated into modern workflows:

- Ransomware or password compromise
  - An account becomes blocked due to a malicious attack against the user.
  - The user can present the verified credential issued by their workplace to re-enable their account.

- An employee leaves your organization
  - When an employee leaves a position within your organization, a termination date is recorded on their workplace credentials.
  - In some cases, the employee may be granted alumni status, enabling access to certain benefits or resources.
  - The employee retains proof of their employment dates, job titles, and more for verification by others.

Accident and password recovery costs extend beyond just the time and money it costs the IT team. Employees are also unable to work while being locked out.Coupling these factors, the average IT ticket for an account or password recovery can cost your organization at least $70.
