

AZURE ARC

WHAT IS AZURE ARC ?

It's a single interface for managing all IT resources - including Windows and Linux servers, SQL database services and containerized environments - whether they are deployed in a private cloud or on a public platform. The solution extends the management and security tools available in Azure to any other IT resource. It is a particularly attractive answer to ensuring consistency in IT management in a multi-cloud environment.

A SUCCESSFUL CLOUD IMPLEMENTATION

Based on the Cloud Readiness Assessment recommendation, we are going to assess your infrastructure in order to implement AZURE Arc. Based on an agent on your on-premises resources, you can easily manage it via the Azure Portal as an Azure resource.

PILOT PHASE

This phase will allow us to validate the technical capabilities and the security expectation of the platform. We are working on different workshops with your different teams (business, network, backup, security) to validate the design.

OUR CLOUD MIGRATION STRATEGY

Our Cloud experts will design the cloud infrastructure to be ready with Azure Arc. We will implement an Azure Arc landing zone while complying with your business, regulatory and legal information.
