

SAS[®] Intelligent Monitoring: User's Guide

0.9.0

This document might apply to additional versions of the software. Open this document in [SAS Help Center](#) and click on the version in the banner to see all available versions.

Product Overview

Intelligent monitoring is the process of tracking and analyzing sensor data in order to detect anomalous behavior. You can use analysis results to create rules to trigger alerts for specific conditions.

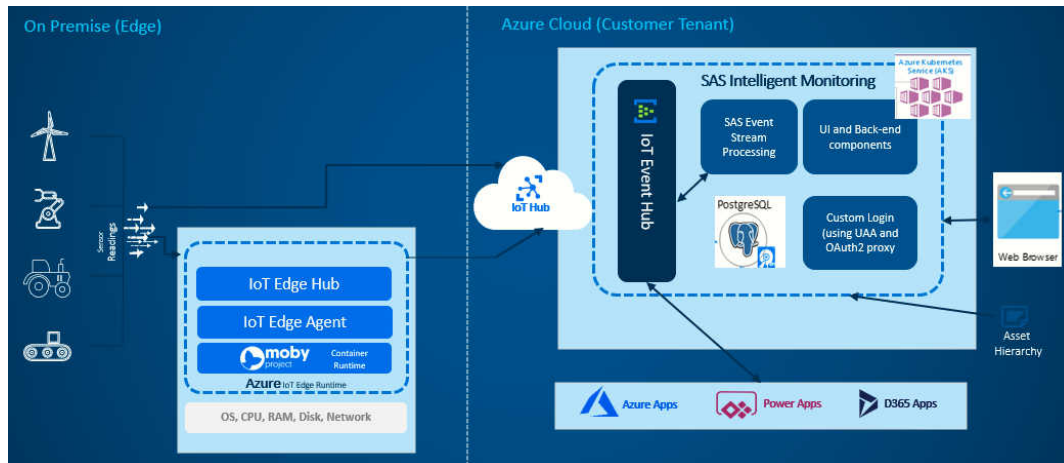

SAS Intelligent Monitoring is an application available from the Azure Marketplace. You can use SAS Intelligent Monitoring to continually monitor your organization's assets and get alerts when pre-defined conditions occur. This can help with effective scheduling of maintenance and maximum asset uptime.

Specifically, you can use SAS Intelligent Monitoring to do the following:

- Create projects targeted at assets to monitor.
- Set up analytics-based scenarios to trigger meaningful alerts in order to take the right action.
- Deploy validated projects to monitor assets in real time.
- Modify projects to keep them running at an optimal level.

SAS Intelligent Monitoring is provisioned in a customer tenant in the Microsoft Azure Cloud

Figure 1 SAS Intelligent Monitoring Architecture

Within a Kubernetes environment, SAS Intelligent Monitoring uses SAS Event Stream Processing to communicate with a Microsoft Azure Event Hub. The Event Hub acquires data from Microsoft IoT Hub, which is the cloud gateway for devices to publish IoT data to the Microsoft Azure cloud.

With a relatively light footprint, SAS Intelligent Monitoring uses Kubernetes services to facilitate easy management of output data. This can lead to easy consumption of alerts through downstream services such as PowerBI.

Deploying SAS Intelligent Monitoring in Microsoft Azure

The following steps enable you to deploy SAS Intelligent Monitoring in Microsoft Azure.

IMPORTANT SAS Intelligent Monitoring is currently provided as a limited access preview of the live application. Access to the preview is by invitation only and for a limited time. During the preview phase, there is no cost to use the software. Users must deploy the application in their own Microsoft Azure environment and cover any environment-related costs.

The notification that you received in order to use SAS Intelligent Monitoring provides a link to the application's page in the Azure Marketplace.

Monitor sensor data by defining streaming analytics rules that trigger real-time alerts

Intelligent monitoring involves the continuous collection of real-time sensor data from assets. The analysis of that data is used to understand root causes of abnormal behavior issues as well predict trends. Analysis results can be used, for example, to service assets at the right time and frequency, before downtime occurs in a manufacturing environment.

SAS® Intelligent Monitoring is an application available from the Azure Marketplace that engineers can use to monitor the status of sensor data on their available assets using user-defined criteria and limits.

- 1 On the application's page, click **GET IT NOW**.
- 2 Click **Continue** to agree to the terms of use and privacy policy.
- 3 On the SAS Intelligent Monitoring (preview) screen, click **Create**.

Workflow

After you have deployed SAS Intelligent Monitoring, the workflow encapsulates a definition of assets and rules for monitoring them.

Figure 2 SAS Intelligent Monitoring Workflow

- 1 Prepare for data ingestion. This involves the following:
 - Linking the Azure IoT Hub collecting data from your device to the Azure Event Hub running in SAS Intelligent Monitoring.
 - Creating a JSON data structure that expresses the format of the data collected from your device.
 - Creating input configuration files for the SAS Intelligent Monitoring application.
- 2 To better understand the data that streams from your device, you can create a data profile before you set up monitoring rules. Through data injection from the IoT hub, the data profile uses SAS Event Stream Processing to acquire data from sensors on relevant assets.
- 3 Define a logic block to determine the range of data to be monitored.
- 4 Create a project that configures an asset hierarchy, a logic block, a range of devices to monitor, and alarm settings. Implement the project through a deployment. There is a one-to-one connection between a project and a deployment.
- 5 Run a deployment. As the deployment runs, triggered alarms are visible on the landing page. Based on what the alarms indicate, you can update project parameters and redeploy the configuration.

Preparing for Data Ingestion

Overview

SAS Intelligent Monitoring uses an instance of Azure Event Hub to receive data from an externally deployed Azure IoT Hub. The Azure IoT Hub collects data from external devices. The Azure Event Hub must share the same subscription as the Azure IoT Hub.

The data ingestion process involves the following steps:

- Linking the [Azure IoT Hub](#) that is collecting data from your device to the [Azure Event Hub](#) that is used by SAS Intelligent Monitoring.

IMPORTANT This is the responsibility of the Microsoft Azure administrator and must occur before any subsequent step of the process.

- Creating a JSON data structure that expresses the format of the input data collected from your device.
- Creating input configuration files for the SAS Intelligent Monitoring application.

Creating a JSON Data Structure for Input Data

The input data collected from external devices must conform to a specific format expressed in a JSON structure. The JSON objects within the structure must have a name and must contain the following attribute-value pairs:

- an arbitrary ID name and value for a device to be monitored
- an arbitrary ID name and value for a specific sensor on the device
- a value name and measurement obtained from the specified sensor
- a time stamp label and value

You customize the data structure name and attribute names in the [Event Hub Mappings CSV input file](#).

Here is the JSON data structure:

```
{
  telemetryDataList: [
    {
      devId: "3",
      varId: "2527",
      value: value,
      date: "Jan 21, 2021 01:28:19 PM"
    },
    {
      devId: "4",
      varId: "3328",
      value: value,
      date: "Jan 21, 2021 01:28:19 PM"
    }
  ]
}
```

This data structure has the name `telemetryDataList`. There are two JSON objects within the structure that contain the following specific attribute-value pairs.

- for the device: `devID: "3"` and `devId: "4"`
- for the sensor: `varID: "2527"` and `varId: "3328"`
- for the measurement: `value: value`
- for the time stamp: `date: "Jan 21, 2021 01:28:19 PM"`

IMPORTANT It is critical that all values specified within the JSON objects are STRING.

Notice that each JSON object in the array (that is, each { } object that contains devID, varID, value, and date) represents one single-value sensor.

Each device (represented by devID) can have multiple single-value sensors. Each sensor for a device is its own JSON object in the array. For example, device 3 (devID: "3") could have a total of ten sensors, each with different varIDs. This results in a telemetryDataList array that contains nine additional JSON objects.

```
{
  telemetryDataList: [
    {
      devId: "3",
      varId: "2527",
      value: value,
      date: "Jan 21, 2021 01:28:19 PM"
    },
    {
      devId: "3",
      varId: "2538",
      value: value,
      date: "Jan 21, 2021 01:28:19 PM"
    },
    {
      devId: "3",
      varId: "2539",
      value: value,
      date: "Jan 21, 2021 01:28:19 PM"
    },
    .
    .
    .
    {
      devId: "4",
      varId: "3328",
      value: value,
      date: "1/13/21"
    },
  ],
}
```

Creating Input Configuration Files

Using information from the JSON objects created, you must manually create the following input configuration files in CSV format:

Table 2 Input Configuration Files Required to Define an Asset Hierarchy

| File | Description |
|-------------------|--|
| EventHub Mappings | Associates devices, data formats, and the structure of the data to expect from the IoT Hub . SAS Event Stream Processing uses the EventHub mapping file to process data from the IoT Hub. |
| Asset Tags | Associates device categories, subsystems, sensors, and characteristics of the data collected from those sensors. All the sensors that you expect to monitor must be defined in this file. |
| Asset Hierarchy | Specifies a set of devices from which you obtain data. All devices that you expect to monitor must be listed in this file. The hierarchy is specific to your workplace. It is usually location-based with the hierarchy drilling down several levels (for example, country, state, city, facility, floor, and so on). |

You can download templates of these CSV files from the Azure Marketplace. Put the templates on a local file system and edit them as you need.

IMPORTANT Every device listed in the Asset Hierarchy file must have at least one corresponding sensor in the Asset Tags file.

Here is the sample Event Hub Mappings file.

Figure 3 Sample Event Hub Mappings File

| DEVICE_CAT | DEVICE_SUB_CAT | Data Format (CSV/JSON) | DEVICE_ID | SENSOR_ID | Value | Timestamp |
|------------|----------------|------------------------|-------------------------------|----------------------------|----------------------------|---------------------------|
| CNC | Controller1 | JSON | telemetryDataList[*].deviceId | telemetryDataList[*].varId | telemetryDataList[*].value | telemetryDataList[*].date |
| CNC | Controller2 | JSON | telemetryDataList[*].deviceId | telemetryDataList[*].varId | telemetryDataList[*].value | telemetryDataList[*].date |

Each row of this CSV file represents the format of the data received for a specific device category.

Table 3 Fields of an Event Hub Mappings File

| Field | Description |
|------------------------|--|
| DEVICE_CAT | Specifies a device category. Example: <code>CNC</code> |
| DEVICE_SUB_CAT | Specifies the device subcategory. Example: <code>Controller1</code> and <code>Controller2</code> Note: All devices of the same subcategory have exactly the same sensors. |
| Data Format (CSV/JSON) | IMPORTANT You must specify <code>JSON</code> . |

| Field | Description |
|-----------|---|
| DEVICE_ID | <p>Corresponds to the name of the previously defined JSON structure, referring to the <code>devID</code> attribute.</p> <p>Example: <code>telemetryDataList[*].devID</code></p> <p>The <code>devID</code> value must be in string format.</p> <p>IMPORTANT The <code>devId</code> attribute name must directly map to the one specified in the JSON structure.</p> |
| SENSOR_ID | <p>Corresponds to the name of the previously defined JSON structure, referring to the <code>varID</code> attribute.</p> <p>Example: <code>telemetryDataList[*].varID</code></p> <p>The <code>varID</code> value must be in string format.</p> <p>IMPORTANT The <code>varId</code> attribute name must directly map to the one specified in the JSON structure.</p> |
| Value | <p>Corresponds to the name of the previously defined JSON structure, referring to the <code>value</code> attribute.</p> <p>Example: <code>telemetryDataList[*].value</code></p> <p>The <code>value</code> value must be numerical, either INT or FLOAT.</p> <p>IMPORTANT The <code>value</code> attribute name must directly map to the one specified in the JSON structure.</p> |
| Timestamp | <p>Corresponds to the name of the previously defined JSON structure, referring to the <code>date</code> attribute.</p> <p>Example: <code>telemetryDataList[*].date</code></p> <p>The timestamp value must be a STRING value that represents the time. The following format is recommended: 'Jan 21, 2021 01:28:19 PM'.</p> <p>IMPORTANT The <code>date</code> attribute name must directly map to the one specified in the JSON structure.</p> |

Here is the corresponding Asset Tags file.

Figure 4 Sample Asset Tags File

| DEVICE_CAT | DEVICE_SUB_CAT | DEVICE_SUBSYSTEM | SENSOR_ID | SENSOR_ALIAS (OPT) | DATA_TYPE | UNITS_OF_MEASURE | UPPER_LIMIT (OPT) | LOWER_LIMIT (OPT) |
|------------|----------------|------------------|-----------|--|-----------|------------------|-------------------|-------------------|
| CNC | Controller1 | Bearing | 2527 | value of the axis/spindle current - Axis X | DOUBLE | A | 250 | 50 |
| CNC | Controller1 | Bearing | 2528 | value of the axis/spindle current - Axis Y | DOUBLE | A | 250 | 50 |
| CNC | Controller1 | Bearing | 2529 | value of the axis/spindle current - Axis Z | DOUBLE | A | 250 | 50 |
| CNC | Controller1 | Bearing | 2551 | Actual tool base position Axis X | DOUBLE | mm | 250 | 50 |
| CNC | Controller1 | Bearing | 2552 | Actual tool base position Axis Y | DOUBLE | mm | 250 | 50 |
| CNC | Controller1 | Bearing | 2553 | Actual tool base position Axis Z | DOUBLE | mm | 250 | 50 |
| CNC | Controller2 | Bearing | 3427 | value of the axis/spindle current - Axis X | DOUBLE | A | 250 | 50 |
| CNC | Controller2 | Bearing | 3328 | value of the axis/spindle current - Axis Y | DOUBLE | A | 250 | 50 |
| CNC | Controller2 | Bearing | 3529 | value of the axis/spindle current - Axis Z | DOUBLE | A | 250 | 50 |
| CNC | Controller2 | Bearing | 3451 | Actual tool base position Axis X | DOUBLE | mm | 250 | 50 |
| CNC | Controller2 | Bearing | 4352 | Actual tool base position Axis Y | DOUBLE | mm | 250 | 50 |
| CNC | Controller2 | Bearing | 5453 | Actual tool base position Axis Z | DOUBLE | mm | 250 | 50 |

Table 4 Fields of an Asset Tags File

| Field | Description |
|-------------------|--|
| DEVICE_CAT | Corresponds to the values of DEVICE_CAT in the Event Hub mapping file. |
| DEVICE_SUB_CAT | Corresponds to the values of DEVICE_SUB_CAT in the Event Hub mapping file. |
| DEVICE_SUBSYSTEM | A descriptive label for a specific subsystem on the specified device subcategory. |
| SENSOR_ID | Corresponds to the values of SENSOR_ID in the Event Hub mapping file. |
| SENSOR_ALIAS(OPT) | A description of what measurement is collected from the specified sensor. |
| DATA_TYPE | Specifies the data type of the measurement collected from the specified sensor. This must be expressed as a numerical value. |
| UNITS_OF_MEASURE | Specifies the units of measurement collected from the specified sensor. |
| UPPER_LIMIT (OPT) | Specifies the upper limit of values to be accepted from the specified sensor. You can set alerts on these thresholds. |
| LOWER_LIMIT (OPT) | Specifies the lower limit of values to be accepted from the specified sensor. You can set alerts on these thresholds. |

Here is the corresponding Asset Hierarchy file.

Figure 5 Sample Asset Hierarchy File

| DEVICE_ID | DEVICE_ALIAS | DEVICE_CAT | DEVICE_SUB_CAT | DEVICE_DESCR | MANUFACTURER | MANUFACTURER_MODEL | INSERVICE_DATE | LOC_LVL_1 | LOC_LVL_2 | LOC_LVL_3 | LOC_LVL_4 | LOC_LVL_5 |
|-----------|----------------------|------------|----------------|---------------------|--------------|--------------------|----------------|---------------|-----------|-----------|--------------|-----------|
| 3 | SiemensCNCPowerLine1 | CNC | Controller1 | CNC Siemens 840D PL | Siemens | SRV250 | 1/1/2020 | United States | Ohio | Columbus | XYZ Facility | Floor1 |
| 4 | SiemensCNCPowerLine2 | CNC | Controller2 | CNC Siemens 840D PL | Siemens | STP500 | 1/1/2020 | United States | Ohio | Columbus | ABC Plant | Floor2 |

This hierarchy must contain the following three fields: `DEVICE_ID`, `DEVICE_CAT`, and `DEVICE_SUB_CAT`, which correspond to the values specified in the Event Hub mapping file.

IMPORTANT The values in `DEVICE_ID` must directly match the values provided in the `devId` field in the JSON structure.

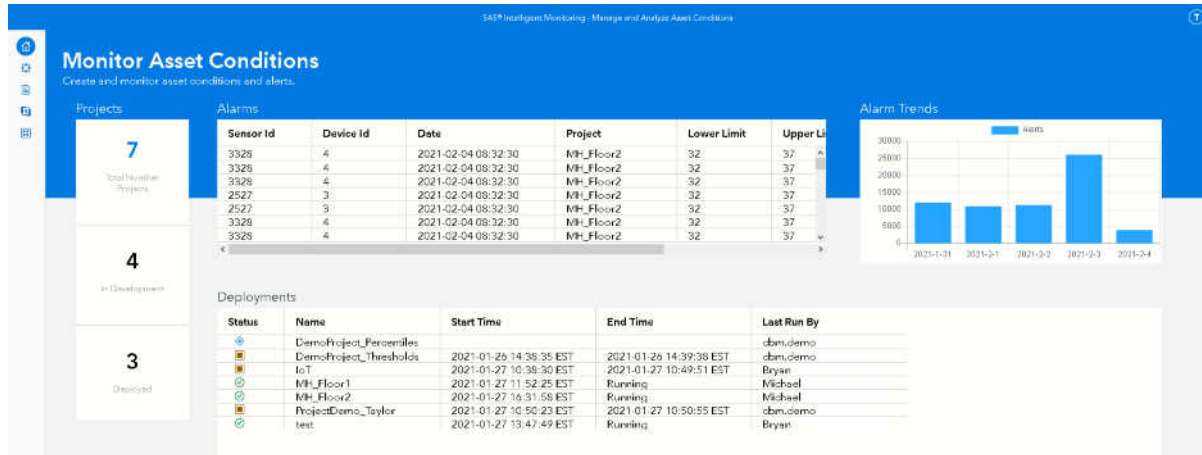

There can be only one root node at the top of the Asset Hierarchy. Thus, the value of `LOC_LVL_1` must be the same for each of the listed Devices.

The remainder of the file can be structured as needed in order to reflect the distribution of devices within an industrial setting.

Navigating the User Interface

When you access SAS Intelligent Monitoring, the landing page appears.

Figure 6 SAS Intelligent Monitoring Landing Page

The center of the page displays the following:

Table 5 Landing Page

| Item | Description |
|--------------|---|
| Projects | A count of the total number of active projects, projects in development, and deployed projects. |
| Alarms | A list of the latest alarms. |
| Alarm Trends | A graphical representation of trends that have appeared over a specified period. |
| Deployments | A list of deployments, by date and time of update, that shows their status and who last updated them. |

The toolbar on left side of the landing page enables you to create and maintain the following items.

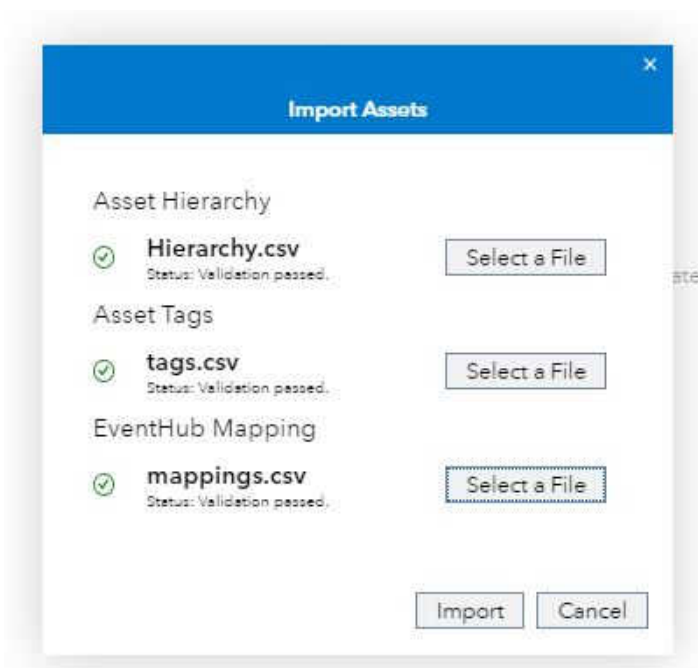

Table 6 Icons on the Toolbar

| Icon | Item |
|---|----------------------------|
|  | Landing page |
|  | Import Configuration Files |

| Icon | Item |
|---|---------------|
|  | Data Profiles |
|  | Projects |
|  | Deployments |

Importing Input Configuration Files

- 1 Click  to navigate to the Asset Hierarchy and Sensor Attributes page. If no hierarchy exists, you are prompted to import the assets.
- 2 Click **Import Assets** to import [the CSV files you had previously prepared](#) into the system.
- 3 In the Import Assets dialog box, click **Select a File** to import CSV files that you had imported to your local file system. After you have selected each of the required files, you are prompted to import them into the system.

- 4 Click **Import**.

Note: Only one hierarchy can exist at a time, and every leaf node on a hierarchy is a device.

- 5 Select a device to see details about it. A device almost always contains multiple sensors. For example, in the figure below, the selected power line device contains six sensors from which data is collected.

Asset Hierarchy and Sensor Attributes

- ▼ United States
- ▼ Ohio
- ▼ Columbus
- ▼ XYZ Facility
- ▼ Floor1
 - SiemensCNCPowerLine1
- ▼ ABC Plant
 - ▼ Floor2
 - SiemensCNCPowerLine2

Device Alias: SiemensCNCPowerLine2

Device ID: 4 Category: CNC
Sub Category: Controller2 Manufacturer Model: STP500 Manufacturer: Siemens
Install Date: 2020-01-01

| Sensor Attributes | | EventHub Mapping | | | |
|-------------------|-----------|-------------------|------|-----------|-------|
| Sensor | Subsystem | Alias | Unit | Data Type | Upper |
| 3328 | Bearing | value of the a... | A | DOUBLE | 250 |
| 3427 | Bearing | value of the a... | A | DOUBLE | 250 |
| 3451 | Bearing | Actual tool b... | mm | DOUBLE | 250 |
| 3529 | Bearing | value of the a... | A | DOUBLE | 250 |
| 4352 | Bearing | Actual tool b... | mm | DOUBLE | 250 |
| 5453 | Bearing | Actual tool b... | mm | DOUBLE | 250 |

A specific device has the same sensors regardless of location. For example, SiemensCNCPowerLine2 contains sensors 3328, 3427, and so on regardless of how many floors you place it.

You can click  to change the **Device Alias**.

Creating a Data Profile

To better understand the data that streams from your device, you can create a data profile before you set up monitoring rules. The data profile collects sensor data from a selected set of devices for a time period that you specify. It generates a standard set of statistics to enable a better understanding of the data. Those statistics can help you create more targeted monitoring rules.

The first time that you click , the new data profile page appears.

- 1 Click **New Data Profile**.
- 2 In the **New Data Profile** dialog box, name the data profile, select your desired subset, and click **OK**.

Figure 7 Create a Data Profile

New Data Profile

Name: *

Tag Selection: *

- ▼ United States
 - ▼ Ohio
 - ▼ Columbus
 - ▼ XYZ Facility
 - ▼ Floor1
 - SiemensCNCPowerLine1

Creating and Maintaining Projects

A project is a workspace that assembles your selected devices and tags with your chosen monitoring logic. You deploy a project in order to apply it to a live data stream from your devices.

To create a project, click  to navigate to the Project Configuration page.

If no projects have been created, then you are prompted to create a new one.

Create New Project

You have not created any projects yet. Create a project to get started.

[Create New Project](#)

If projects exist, then a list of them appears. Click  to create a new one.

Either action initiates a wizard that guides you through the process of setting the following:

- logic blocks or statistical process controls
 - relevant asset tags
 - thresholds to be applied to the appropriate device
 - alarms
- 1 Enter a project name and, if wanted, a project description.
 - 2 Set logic blocks. You can use one of two standard logic blocks or you can apply one or a combination of eight Shewhart rules.

Table 7 Set Logic Block Selections

| Selection | Description | Where to Adjust Values |
|--|--|---|
| Use standard logic blocks: Use values from imported assets | Uses the upper and lower limit thresholds that are imported from your asset hierarchy files. | You can adjust these values on the Select Sensors and Manage Thresholds page. |
| Use standard logic blocks: Use data profile values Note: You can use values only from a stopped data profile. | Select a Data Profile . Then set a Lower Threshold and an Upper Threshold . | You can adjust these values on the Select Sensors and Manage Thresholds page |
| Use statistical process controls | Provides eight standard Shewhart rules. | You cannot adjust these values. |

- 3 Unless you have chosen the logic block **Use standard logic blocks: Use values from imported assets**, select a specific set of devices here.

- 4 Select the desired set of sensors to monitor. You must select at least one sensor from each drop-down. For example, suppose you have two drop-downs: **Controller1 CNC (1)** and **Controller2 CNC (1)**.

> Controller1 CNC (1)

> Controller2 CNC (1)

You must select at least one sensor from each.

| ▼ Controller1 CNC (1) | | | | | |
|-------------------------------------|--------|-----------|-------------------|------|-----------|
| <input type="checkbox"/> | Sensor | Subsystem | Alias | Unit | Data Type |
| <input type="checkbox"/> | 2527 | Bearing | value of the a... | A | DOUBLE |
| <input checked="" type="checkbox"/> | 2528 | Bearing | value of the a... | A | DOUBLE |
| <input type="checkbox"/> | 2529 | Bearing | value of the a... | A | DOUBLE |
| <input type="checkbox"/> | 2551 | Bearing | Actual tool b... | mm | DOUBLE |
| <input type="checkbox"/> | 2552 | Bearing | Actual tool b... | mm | DOUBLE |
| <input type="checkbox"/> | 2553 | Bearing | Actual tool b... | mm | DOUBLE |

| ▼ Controller2 CNC (1) | | | | | |
|-------------------------------------|--------|-----------|-------------------|------|-----------|
| <input type="checkbox"/> | Sensor | Subsystem | Alias | Unit | Data Type |
| <input type="checkbox"/> | 3328 | Bearing | value of the a... | A | DOUBLE |
| <input type="checkbox"/> | 3427 | Bearing | value of the a... | A | DOUBLE |
| <input checked="" type="checkbox"/> | 3451 | Bearing | Actual tool b... | mm | DOUBLE |
| <input type="checkbox"/> | 3529 | Bearing | value of the a... | A | DOUBLE |
| <input type="checkbox"/> | 4352 | Bearing | Actual tool b... | mm | DOUBLE |
| <input type="checkbox"/> | 5453 | Bearing | Actual tool b... | mm | DOUBLE |

Depending on the logic that you selected, you can adjust upper and lower limits per sensor.

| IMPORTED VALUES | | | | | | | |
|-------------------------------------|--------|-----------|-------------------|------|-----------|-------|-------|
| ▼ Controller2 CNC (1) | | | | | | | |
| <input type="checkbox"/> | Sensor | Subsystem | Alias | Unit | Data Type | Lower | Upper |
| <input checked="" type="checkbox"/> | 3328 | Bearing | value of the a... | A | DOUBLE | 50 | 250 |
| <input type="checkbox"/> | 3427 | Bearing | value of the a... | A | DOUBLE | 50 | 250 |
| <input type="checkbox"/> | 3451 | Bearing | Actual tool b... | mm | DOUBLE | 50 | 250 |
| <input type="checkbox"/> | 3529 | Bearing | value of the a... | A | DOUBLE | 50 | 250 |
| <input type="checkbox"/> | 4352 | Bearing | Actual tool b... | mm | DOUBLE | 50 | 250 |
| <input type="checkbox"/> | 5453 | Bearing | Actual tool b... | mm | DOUBLE | 50 | 250 |

The lower value that you specify must be less than the upper value that you specify.

5 Set alarm parameters.

1 Name and Description ✓

2 Set Logic Blocks ✓

3 Select Devices ✓

4 Select Sensors and Manage Thresholds ✓

5 Configure Alarms ✓

Set the amount of time the logic block condition should persist before activating an alarm.

Alarm Persistence: * 6 Frequency: * hours

Set the amount of time the logic block condition is silent before activating the alarm again.

Alarm Latch: * 6 Frequency: * hours

For Alarm Persistence, specify a period of time over which to apply your logic block to data streaming from the sensors. This should be an interval over which you think that data meeting the condition of the logic block constitutes an event worth investigating.

For Alarm Latch, specify a period of time to let the logic block lapse before reactivating the alarm. This should be a function of how long it takes to address a discovered issue.

IMPORTANT This selection is inoperative for Release 0.9.0.

6 Click **Finish**.

The project definition appears on the Project Configurations page.

Project Configurations

| Name | Last Updated | Last Run By |
|-----------|-------------------------|------------------|
| ABC_plant | 2020-12-14 18:27:05 UTC | cbm.demo@sas.com |

The system automatically creates a deployment that corresponds to the project.

- Click  to navigate to the Deployments page.

Creating and Running Deployments

After you add a project, a deployment for it is automatically populated.

- Click  to navigate to the Deployments page. Any deployments that are ready to run () , already running () , and stopped () are displayed.

Deployments

| Status | Name | Start Time | End Time | Last Run By |
|---|----------------------|-------------------------|----------|-------------|
|  | ABC_1 | 2020-12-16 15:09:54 EST | Running | cbm.demo |
|  | Ohio | | | cbm.demo |
|  | SampleProject_Taylor | 2020-12-15 19:19:55 EST | Running | cbm.demo |
|  | XYZ_1 | 2020-12-16 12:30:30 EST | Running | cbm.demo |

- Select a deployment ready to run.

- Click  to run the deployment.

After a short time, the deployment is displayed with the running **Status**.

Deployments

| Status | Name | Start Time | End Time | Last Run By |
|---|----------------------|-------------------------|----------|-------------|
|  | ABC_1 | 2020-12-16 15:09:54 EST | Running | cbm.demo |
|  | Ohio | 2020-12-16 15:23:37 EST | Running | cbm.demo |
|  | SampleProject_Taylor | 2020-12-15 19:19:55 EST | Running | cbm.demo |
|  | XYZ_1 | 2020-12-16 12:30:30 EST | Running | cbm.demo |

SAS Event Stream Manager uses the ESP operator to spin up an ESP server that runs the associated project. The project then does the following:

- attaches to the Event Hub
- consumes data as specified
- analyzes the data as specified in the ESP project
- pushes results into a database

22

- pushes information onto the Event Hub
- continues to monitor the IoT Hub as more data comes in

You can also get the status of a deployment in the form of an alarm or you can check status on the landing page.

After a deployment is running, you can stop it at any time.

- 1 Click the running deployment.

- 2 Click . After a period of time, the deployment shows a stopped status ().
