

Sales Order and Purchasing Barcode App

for Microsoft Dynamics 365 Finance and Operations

The Sales Order and Purchasing Barcode App enables an organization to effectively manage the inflow and outflow of inventory in the warehouse.

Overview:

With the Sales Order and Purchasing Barcode App, a barcode will be generated for every sales order and line items. With the barcode printed, the warehouse user can simply scan the sales order and respective items through RF scanner or mobile devices, while picking and packing the order. Likewise, the user receiving the purchase order can scan the barcodes – this eliminates the need to manually enter the sales order/purchase order and item number in the scanners. By automating the scanning process, one will save a considerable amount of time for an organization and can greatly reduce manual errors, such as typing incorrect item numbers.
