Intelligent compliance and risk management solutions

Microsoft 365 helps you assess compliance risks, govern and protect sensitive data, and effectively respond to regulatory requirements.
Two challenges every organization, including Microsoft, must face:

- Exponential growth of data and the proliferation of insider risk
- Constantly evolving external regulations and standards

**Information Protection and Governance**
Protect and govern your data wherever it lives

- **Understand your data landscape:** volume, scope, and location of your information. The first step to better protect your data is get your data out of the ‘dark’ and know where it lives
- **Detect and classify** sensitive information types with Data Classification leveraged by machine learning
- **Automatically retain,** delete, and store data and records in compliant manner
- **Apply flexible protection** actions including encryption, visual markings, and data loss prevention to help meet internal security goals and external compliance requirements

**Compliance Management**
Simplify compliance and reduce risk

- **Continuously assess,** improve, and monitor compliance effectiveness with a risk-based score that automatically detects implemented controls
- **Maximize your score** with recommended actions and step-by-step guidance
- **Leverage built-in control mapping** to help stay current with the evolving compliance landscape

**Compliance offerings for national, regional, and industry-specific requirements**

- CCPA
- FedRAMP
- GDPR
- HIPPA
- ISO 27001 & 27018
- NIST 800-53
- SOC
- and many more
Insider Risk Management

Intelligently identify and take action on critical insider risks

- **Ensure the right people** across security, HR, legal, privacy, and compliance are connected and equipped to promptly identify and act on insider threats
- **Obtain real-time updates** on file activity, communications sentiment, abnormal user behaviors and resignation dates
- **Identify hidden patterns and risks** that traditional or manual methods might miss through configurable playbooks that use machine learning and intelligence

Discover and Respond

Investigate and respond with relevant data

- **Use search and discovery tools** to easily find customer data that may be the subject of a DSR (Data Subject Request). Organizations are obligated by regulations like GDPR and CCPA to respond to customer’s requests to delete, access, and receive their personal information
- **Run content searches** across mailboxes and sites in your Microsoft 365 organization. Review and redact content prior to export to help ensure that only the most relevant data is being shared, and that any business confidential pieces of that data are redacted
- **Use eDiscovery Cases** to add members who can access the case, place a hold on content locations relevant to the case, associate multiple Content Searches with the case, and export the search results from the case
