

How It Works

Vaporstream is an enterprise communication platform that enables private business conversations.

- Enterprise policies give businesses complete control of their messaged information
- Mobile application built to have “Privacy by Design”
- Automated message expiration policies ensure messages never linger on devices
- A copy of record can be retained in an archive of your choice for compliance purposes
- Encryption of data in transit and at rest

VS Messaging

Vaporstream’s seamless, intuitive mobile messaging application goes beyond end-to-end encryption with advanced content controls and enterprise policies to protect your private business information – even after it reaches other devices. Advanced content controls prevent users from storing information on their devices, saving it to the cloud or sharing it with unintended recipients. Enterprise policies for message expiration, group collaboration and external communications enable your users to have private, confidential business conversations.

VS Compliance

Vaporstream Compliance enables you to archive messages into a repository of your choice. You own and control your archive so that you can seamlessly integrate with your compliance workflows, reporting and e-discovery tools.

The Vaporstream Difference

We put privacy in the hands of your enterprise:

- Send disappearing messages while maintaining compliance
- Automatically wipe messages from all devices and shred on demand
- Communicate privately and securely with external users
- Prevent users from storing information on their devices or saving it to the cloud
- Prevent forwarding, copying or taking screenshots of messages
- Scan documents without storing to device memory or cloud backups
- Store and control your archive to seamlessly integrate with your compliance workflows
- Display user information and message content separately if extra privacy is needed
