Microsoft AppSource

 **Microsoft** | Dynamics 365

Manufacturers who have multiple levels of BOMs and product variants, find it challenging to maintain best practice in version control.

What is the Item Versioning accelerator by Prodware?

When modifying a component's version number, the impacts must be managed on the upper levels too. This can be prone to error, heavy admin or just not happen at all.

Item Versioning creates a structure and workflow to minimize errors, double-admin and puts processes in place for who can change what in product management, directly in Dynamics 365 for Finance and Operations.

Why choose the Item Versioning accelerator?

Item Versioning boosts standard Dynamics 365 for Finance & Operations' functionality by:

- Centralizes escalation requests for item changes
- Provides a framework and process for version changes of released products
- Stores tasks and allow notifications of changes throughout the organization

Set it up your way

- Define index groups and their values for released products
- Define number sequences for creating engineering change orders

Easy change management

The engineering change order contains additional functions:

- Create, view details and check status
- Mini workflow to evolve the change order (from Verified to Applied)
- Add comments via memo
- View old and new index numbering

Visualize change impacts

- View both ascending and descending impacts of proposed changes.
- Easily view on released product screen the details and the impact in a hierarchy tree.
