Healthcare – EMR and Patient Booking System

Solution overview

Our customizable Electronic Medical Records and Patient Booking System allows for a centralized experience of patient/clinic/provider management through Microsoft Teams conversations and meetings, as well as Outlook Emails and Calendars. Manage the provider or clinician, create provider groups, manage and search patient files and consultation histories, book consultations, exchange information between clinician and more, all linked to the patient file. We will demo the solution at hand, learn the specific business outcomes desired for your project. We will tweak the solution and maintain the solution through a SaaS model afterwards.
Opportunity

Digitize and centralize medical documents and bookings with the tools you already pay for with Microsoft 365 and the Power Platform. The app uses native Outlook calendars for patient/provider bookings and overlays, stores conversations between the clinics and providers in Microsoft Teams, creates logical links between the files' metadata and the documents for each patient and provider. Minimize the Microsoft licensing and get a better ROI compared to other EMR systems.
