Digital transformation has enabled incredible efficiencies, but it has also led to a dramatic increase in security risks—like ransomware—that are more complex than ever before, causing costly breaches, business disruption, and loss of critical data.

Pinpointing these threats requires you to know how adversaries operate—and security solutions are only as good as their threat intelligence.

What is threat intelligence?

Threat intelligence is the contextual knowledge about threat actors, including their motivations, capabilities, techniques, and infrastructure—and it’s key to detecting and addressing threats with minimal false positives.

Microsoft derives leading threat intelligence from more than 24 trillion security signals collected daily, paired with the expertise of leading cybersecurity experts. This threat intelligence, paired with AI, is key to detecting the threats built into Microsoft’s 365 and 20 products—including Microsoft Sentinel, Microsoft 365 Defender, and Microsoft Defender for Cloud.

Unmask your adversaries, their infrastructure, and their tooling

But threat actors are constantly evolving. Via the internet, you are potentially connected to every other entity, including adversaries. In a rapidly-changing landscape, access to raw threat intelligence enables you to quickly uncover the full extent of an adversary and their infrastructure.

Unlock visibility into your adversaries

Threats are evolving every single day, and so is their infrastructure. Microsoft Defender Threat Intelligence uses direct observations and dynamic threat intelligence to unmask threat actors and their tools—allowing you to track from adversaries early.

Enhance your security stack with threat intelligence

Microsoft Defender Threat Intelligence’s analyst portal makes it easy to leverage threat intelligence across your security stack, including both Microsoft and non-Microsoft products, to enhance detections, assist in investigation, and accelerate time to resolution.
