

Azure Virtual Desktop

Enable Secure Remote Work and Quickly Scale to Meet Business Needs

Is your organization struggling to address remote workforce or scale needs with your current environment?

With Microsoft Azure Virtual Desktop (AVD), you can enable your remote workforce and meet constantly changing business needs with the burstable scale and cost efficiency of Microsoft Azure. AVD lets you reduce license costs, leverage automation, and virtualize applications that require specialized hardware without capital investment.

3Cloud delivers an AVD deployment tailored to meet all of your operational and security needs. We start with an initial assessment of your use cases that align to AVD, and then create a customized migration plan. An AVD pilot for selected applications and users helps you test out a limited AVD environment and prepare for a production deployment. Finally, we deploy a full AVD environment and provide operational support as needed.

3Cloud has completed over **150 AVD deployments** and is one of a select group of partners to be awarded the Microsoft Azure Virtual Desktop Advanced Specialization. Let's talk about how we can enable your success with AVD.

AVD Engagement Steps:

- **Azure Landing Zone** – provide a scalable and well-governed Azure environment to serve as the foundation for AVD deployment
- **Assess and Design** – identify on-prem workloads and user profiles that align to AVD and map migration path
- **Implement and Scale** – deploy a full AVD environment and validate functionality
