Efficient and secure management from the cloud

As resources move to the cloud, System Center products are gaining more and more prominence in cloud service management. However, the System Center family was designed as an On-Premises management solution.
Azure OMS

Operations Management Suit (OMS) is a collection of management services designed from the ground up in the cloud. The OMS components are entirely hosted on Azure. However; This does not mean that OMS services do not have the ability to effectively manage the On-Premises environment. The main functionality of OMS is to provide a set of services that run on Azure. Each of these services provides a specific management function, allowing them to be combined to achieve different management scenarios.

- Infrastructure cost reduction
- Energy consumption savings
- Support and maintenance
- Continuity of service

Security

- 24/7 monitoring
- Backup and recovery of critical data
- Protection of virtual or physical machines
- High availability

Optimization

- Process automation using RunBooks
- Configuration compliance for virtual and physical machines
- Integration with System Center DPM

Management

- Analysis of availability and performance of different resources
- Export and generation of alerts, analysis and dashboards
- Business continuity and strategy
