

Cloud enablement

The Challenge

A digital transformation initiative should always start with a business problem or an opportunity to be successful. Organizations need to disrupt the market or else risk being disrupted by new competitors.

The common denominator of most of these disruptors is that they embrace the public cloud, taking advantage of full elasticity built on the hyper-scale capacity, using it as a foundation for their innovations.

Many of these initiatives are carried out as fail-fast initiatives, without little concern about the cloud environment that the solution ends up in.

This can lead to rampant cost and solutions that are hard to secure and maintain.

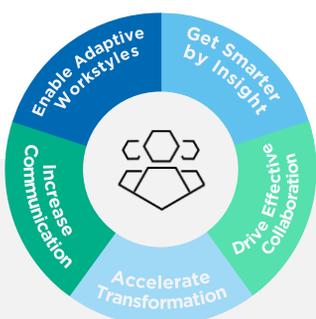

The solution

Before you can start deploying things in the cloud, it's recommended that you set up your so-called landing zone. This means that you have provisioned your subscriptions, applied your architecture and implemented your governance standards.

Based on our experience it's mainly four areas of concerns that need to be addressed when enabling a cloud service:

- Insight & Transparency
- Security & Compliance
- Way of Working
- Optimization & Automation

The value

The motivation to move to the cloud can differ but the main four areas organizations seek benefits from are agility, quality, cost, and enabling new scenarios.

Agility can be the difference between business success or failure. And improved time-to-market can be the gamechanger for an organization.

Service **quality** is not just reliability and scalability but also enhanced security and new possibilities to meet regulatory compliance demands.

There's no guarantee for **cost** savings in moving to the cloud, but the transparency enables a higher degree of input for conscious decisions based on facts and figures instead of projections.

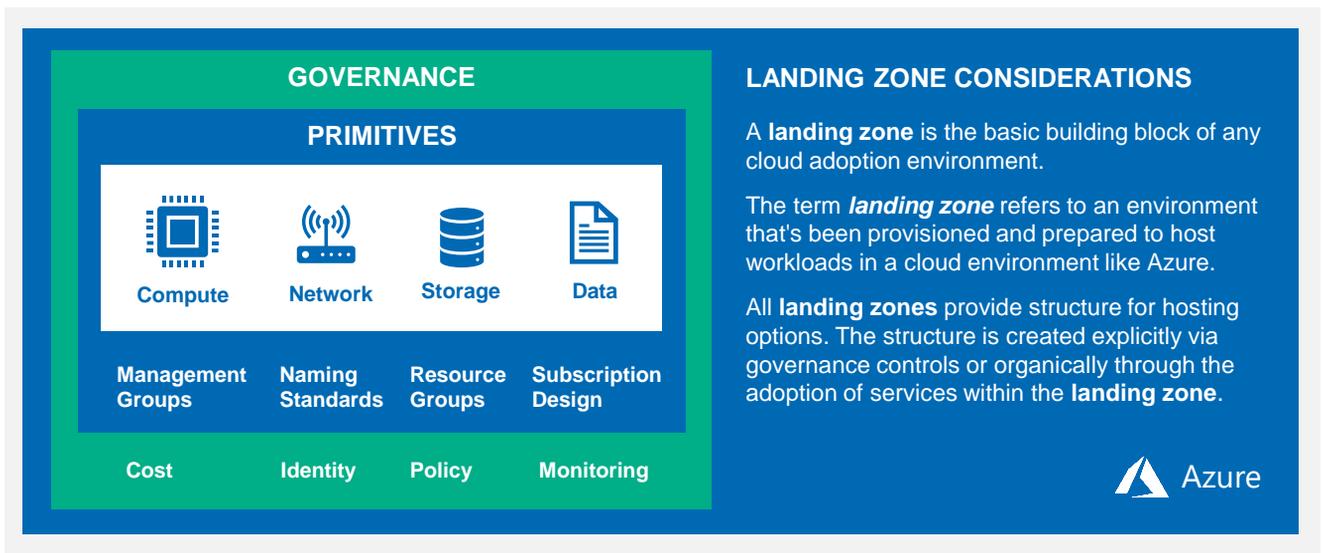

Digital capabilities introduced by the cloud enable **new scenarios** for organizations to create alternate value streams and enhanced options to disrupt existing business models in a faster way.

Cloud enablement

The how

The cloud enablement focuses on enabling the platform, building the foundational landing zone. In most cases the organization would have a business initiative that needs to be hosted somewhere in the cloud and needs a partner that can create that landing zone in a controlled way. Ensuring that the new platform is built according to good practices so that the organization can continue to benefit from it.

Many digital transformation initiatives have been deployed in a new cloud subscription and then just handed over to the business side without proper structure and governance, missing adequate security configuration and monitoring to bring value. But it doesn't take much to do it right from the beginning if you ask an expert.

Why Enfo

Our values are at the core of our actions; collaboration, trust, continuous development and expertise.

We walk beside our customers in their data-driven business transformation, taking ownership of their transformation as if it were our own.

**Mastering
complexity**

**Confidence
in cloud**

**Genuine
care**
