

Microsoft Azure Foundation Deployment

The Challenges

Early adopters of public cloud services like Azure experienced three main challenges; cost overruns, security, and manageability. Enabling’s Azure Foundation Deployment Service applies those lessons learned to provide a fundamental deployment of Azure services. We’ll educate you on how to get started, how to secure the environment, and then guide you through hands on deployment.

Enabling will provide foundational planning, design, and configuration services for up to (2) workloads (domain controller, web server, etc.). Our Azure Specialists will focus on:

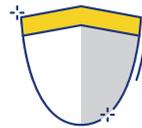

Infrastructure & Network Planning

- Naming conventions
- Azure Resource Manager
- Network Security Groups
- User-defined routing
- VPN connectivity
- ExpressRoute

Cost Management

- Subscriptions and billing
- Rightsizing
- Up/Downscaling
- Resource Tags
- Azure Cost Management/Cloudyn
- Azure Advisor

Security

- Secure RDP access and Multifactor Authentication
- Role Based Access Control
- Azure Defender
- Microsoft vs 3rd party firewall services

HA/DR

- Backup
- Azure Site Recovery
- Storage redundancy options

START YOUR JOURNEY TO AGILE IT.

“It was a really robust planning phase, and that’s the main reason why we had no issues post-migration. The Enabling engineer was really knowledgeable and helped us go through the migration process without major problems.”

IT Director Oluseye Fadiran, Window Nation

OPTIONS

Planning & Design

The result will be a documented plan to build a secure Azure tenant in the future.

Planning, Design & Deployment

The result will be a working Azure tenant with a secure foundation.
