DC VISION® IS A FUTURE PROOF SOFTWARE USING AUGMENTED REALITY AND AI TECHNOLOGY

DC VISION®

Only On 1 July, 2022

Digital Twin and Object Recognition

Creating a 3D digital copy of the entire rack, we use augmented reality to overlay the world with data. Our AR tools help increase the productivity of your engineers, improve their control, ease communications and greatly benefit their skill development. Interact with the Digital Twin to update the data, make notes, detect any anomalies and confirm your work.

To detect any anomalies on your rack – we use object recognition and AI. By comparing this information with asset inventory, we can instantly tell what went wrong. This is a reliable diagnosis method leaving you in position to restore full function as fast as possible.
