

# EasyGov

We would like to introduce ourselves as an award-winning GovTech startup with an innovative platform that comprises 7 unique products designed for transforming social welfare. It's a no-code and 100% configurable platform built on open-source technologies, that works on multiple mobile OS, web interfaces, deployment environments and supports multiple languages.

As the citizens are aware of the flagship schemes of the State Government, they are not always aware of less popular schemes targeting specific groups. This information gap is often exploited by dishonest elements. Welfare scheme delivery suffers due to complexity in the application process and processing of the application. The current welfare delivery system is such that it requires high involvement on the part of the bureaucrats.

EasyGov has been associated with many State Govt. and the most recent one is Karnataka where we have implemented a similar system (Suvidha on top of eKutumba) aiming to disburse 1000 Crores worth of benefits in the next 6 months, and we have already disbursed over 40 Crores in a month. More than 1.5 lac citizens visit our application on MyJio daily. Since we adopt a modular approach in our platform, turnaround time for service and scheme delivery is really low, sometimes only in days. We have also worked with MyGov, the Government of Chhattisgarh, the Government of Tripura, the Government of Bihar.

The adoption of technology to improve last-mile delivery and increased accountability of implementors is required. This can be achieved by transforming welfare schemes from “Design-Discovery-Delivery”. We request your good self to kindly provide us an opportunity at your convenience in your good office for the demonstration of a technically modern and robust platform of EasyGov.
