

Boosting Global Collaboration and Knowledge Share

Chapman Taylor is an award-winning, global practice of architects, with over 400 employees working from 16 design studios across Asia, Europe and the Middle East.

Chapman Taylor's existing project information system (PIM) had outlived its usefulness, featuring a standalone document management system in an on-premises server and some unstructured data. The system also led to some data duplication and information silos, with individual designers and studios saving documents, drawings, contacts and emails to their local on-site servers in different ways. This made it tricky for Chapman Taylor's global studios to fully collaborate and share their expertise.

Chapman Taylor wanted to embrace a fully digital workplace with a cloud-based PIM that maximised the firm's existing Microsoft 365 investment. This needed to be a global solution that provided a single point of access to the latest, most accurate corporate and project information. The goal was to share knowledge and improve collaboration across studios, enabling project teams – including external partners – to work together in real time from wherever, whenever, using the right documents and drawings.
