Camaleón Cloud Sync Manager

Camaleón FSM is a solution that seeks to delegate the administration of the file server to key business users without the need for the intervention of the systems department. Users have different roles: the administrator is the person in the business to whom certain file server tasks are delegated so that he can assign benefits to his work team as needed; the reader can only read the content; and the writer can read, create and edit content.

- Agility in permits and access
