

Product Life cycle Management Analytics powered by the Data Discovery Platform

The customer was facing quite an ubiquitous problem. The project managers in the engineering department were unable to identify the reasons for delay in execution of their projects. There was a need for a single pane view of the processes, that provided an overview into the project health, the status while also being able

to forecast change requests based on historical data . They needed a solution that could diagnose and identify what exactly was the reason behind the bottlenecks, the risks involved. There was in need of a solution that could analyze and predict projects' status and also provide insights in time to avoid untoward delay.

PLM Analytics

Created a Product Lifecycle Management Analytics solution. The solution leverages time series analysis for an in-detail time line analysis, forecast of change requests for different parts and provide part 2D, 3D drawing status along with the change in the project status. It thus allows project managers to view overall project status ,track the risks and delays using understandable, readable and easy to use visualizations.
