

Intelligent Document Processing Tool:

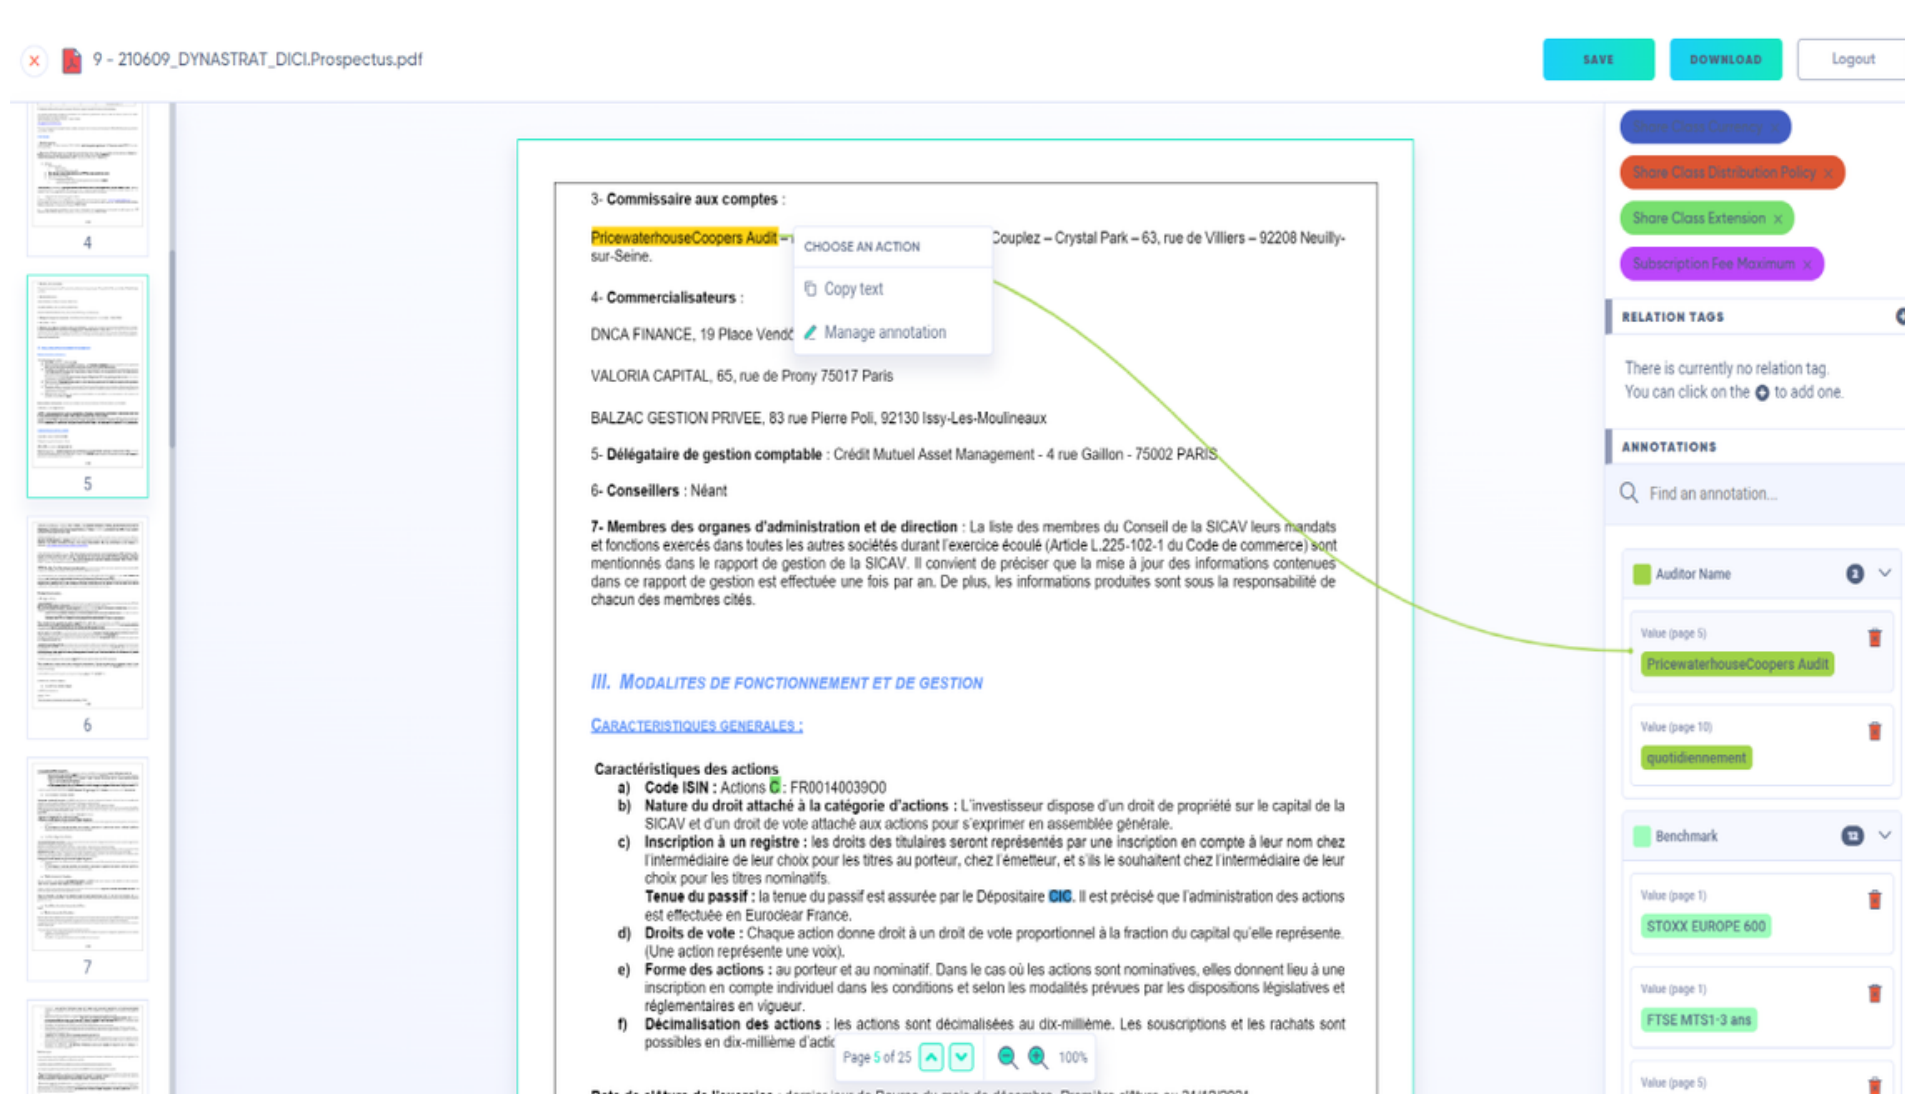

Automate information extraction from financial documents with artificial intelligence

Fortia's Intelligent Document Processing tool allows automating information extraction from financial documents. Artificial intelligence are already trained to extract information from:

The tool loads these documents, detect the language, analyze the format (if native or scanned), it convert it to a suitable format, then AI algorithms extract the needed information (from texts and tables). Once Data extraction is over, it allows for automatic reconciliation between several data sources (Prospectus and KIID from the same fund, two versions of the same document, a document and the Data in a product repository.).

Improve your Data:

Fortia's Intelligent Document Processing tool is user-friendly. The tool is already trained for documents cited above, but it can also learn and extract information from other documents. User can train the tool and reach an 99% accuracy on Data extraction.
