Cardinal Health Delivers Health Outcomes with Computer Vision

Telepharm, a Cardinal Health company, drives adoption of advanced technologies including computer vision to enhance the traditional pharmacy experience. The team is constantly prototyping new solutions, requiring tools that enable quick and agile development. Any given project can be rapidly greenlit for production, which means that the underlying technology must scale with ease.

Roboflow's platform powers Cardinal Health's computer vision model production and deployment. Giving one pharmacist the power to automatically review prescriptions from multiple pharmacies is key to reducing the overall workload, and providing high-quality service to patients everywhere.
