

Boost your productivity and minimize your costs

Archivum is a cloud-based archiving solution which is safe, cost-efficient, and very user friendly without forcing its users to have IT-knowledge.

Access

- + Strive for **transparency** in your company. Give **access to all data** to every employee who needs to work with the data. You do not need your IT department to simply check some invoice file.
- + Easily restrict **access via roles and identities** which map to your security access level. All operations on the platform are **tracked and documented** to always keep the access to data on the highest security level.
- + Give access to your **customers or auditors**. Through the self-explaining User Interface they can search for files by themselves.

Beneficial

- + **Save up to 70%** of your storage costs by an automated archiving management. Your unproductive data can be stored in cheaper storage options and files that are not needed anymore can be deleted automatically.
- + **Save costs** by ignoring the amount of user accounts. For Archivum it does not matter if a 100 or 1000 employees get access.

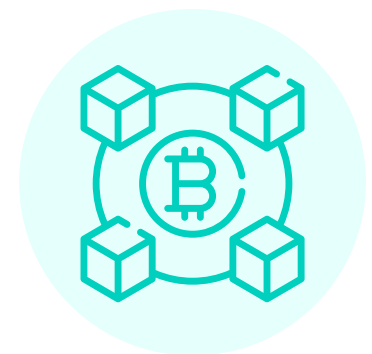

Only **20%** of the whole data within an organization is productive and has mission-critical significance.

80% of the company's data does not need to be immediately accessible and can be stored at a lower cost.

1 FTE per year is needed to recover files for employees without an archiving platform accessible to them (500-person company).

Compliance

- + The solution is audit-proof by using the **"Proof of Existence"** mechanism within the **Bitcoin System** as a trusted partner.
- + An auditor can easily check that a document has not been manipulated.
- + Archivum fulfils all requirements to be called **audit-proof** ("revisionsssicher").

Each of your files becomes a fingerprint in the Bitcoin system, a system that is decentralized and immutable.
