

How to Finally Put an End to Your Data Security Problems

WAULT® (“Portable as a Wallet. Safe as a Vault™”) is the only platform that combines verifiable credentials, secure document storage and sharing with user authentication.

Unlike collaboration platforms such as Dropbox or Google Docs where documents can be changed by anyone with access, WAULT® is an immutable platform for storing and sharing verified documents that you don’t want changed.

This makes WAULT® the ideal secure platform for sharing sensitive documents with verified recipients.

- **Concerned about avoiding wire fraud for your real estate transactions?**
- **Want to control who sees critical financial documents without worrying about email security?**
- **Need to ensure the correct credentials of the recipients of your key documents?**

Use WAULT® for sharing personal identification, legal, financial, and other mission critical documents that are not suitable for email, file based methods, or collaboration tools.

WAULT® is the only secure platform to combine credential verification with secure storage and sharing. And unlike the solutions from Big Tech, WAULT® has no visibility or access to your documents...so your data stays yours and yours alone.

If you'd like to learn more about how WAULT® can improve the security and collaboration of your business while reducing risk, please contact tomc@wmysical.com now to schedule a free consultation.

More About WAULT's® Features:

- Smartphone App for consumers to access their vital information. Nothing is stored on the Smartphone. WAULT® is a patented technology which uses high level encryption methods and distributed technology to ensure the safety of your documents.
- Authenticate the users by a combination of email address, mobile phone, Gov't ID, and biometrics which creates their digital "wallet/vault" or WAULT® account. Subsequent logins use multi-factor authentication. Businesses are verified through 3rd Party validation/ software.
- Only immutable documents are allowed in WAULT®, uploaded via camera on phone or through portal access unless issued directly into the WAULT® via the gov't or some other institution/business entities. For example, paystubs can be issued directly to a person's WAULT® from an employer or the DMV can issue a Driver's License directly to a person's WAULT®.

- WAULT® creates a virtual network where businesses, institutions and consumers can all share documents and information securely with trust because WAULT® has authenticated the identity of all the members of the WAULT® network and secured the documents via patented technology.
- WAULT® app allows the sender of the document to control the sharing. They can set an expiration date, allow the receiver to share with other WAULT® members, allow them to download a copy with or without add a watermark to their document. WAULT® also gives the sender an audit trail of who and when they share the information. The sender can also "unshare" a document. All these features fit well with the new data privacy regulations forthcoming across the various states.
